Any (space) mission is a balance between what science demands, what technology can do, and what budget & schedule allows ... (courtesy Prof. R. Ellis).

Outline

- (1) Recent key aspects of the Hubble Space Telescope (HST) project.
- (2) Measuring Galaxy Assembly and Supermassive Black-Hole Growth.
- (3) What is the James Webb Space Telescope (JWST)?
- (4) How can JWST measure the Epochs of First Light & Reionization?
- (5) Summary and Conclusions.
- (6) How can JWST measure Earth-like exoplanets?
- (7) Update of JWST programatics as of 2011/2012.

Edwin P. Hubble (1889–1953) — Carnegie astronomer

James E. Webb (1906–1992) — Second NASA Administrator

Hubble: Concept in 1970's; Made in 1980's; Operational 1990– \gtrsim 2014.

JWST: The infrared sequel to Hubble from 2018–2023 (–2029?).

**JWST primary
mirror**

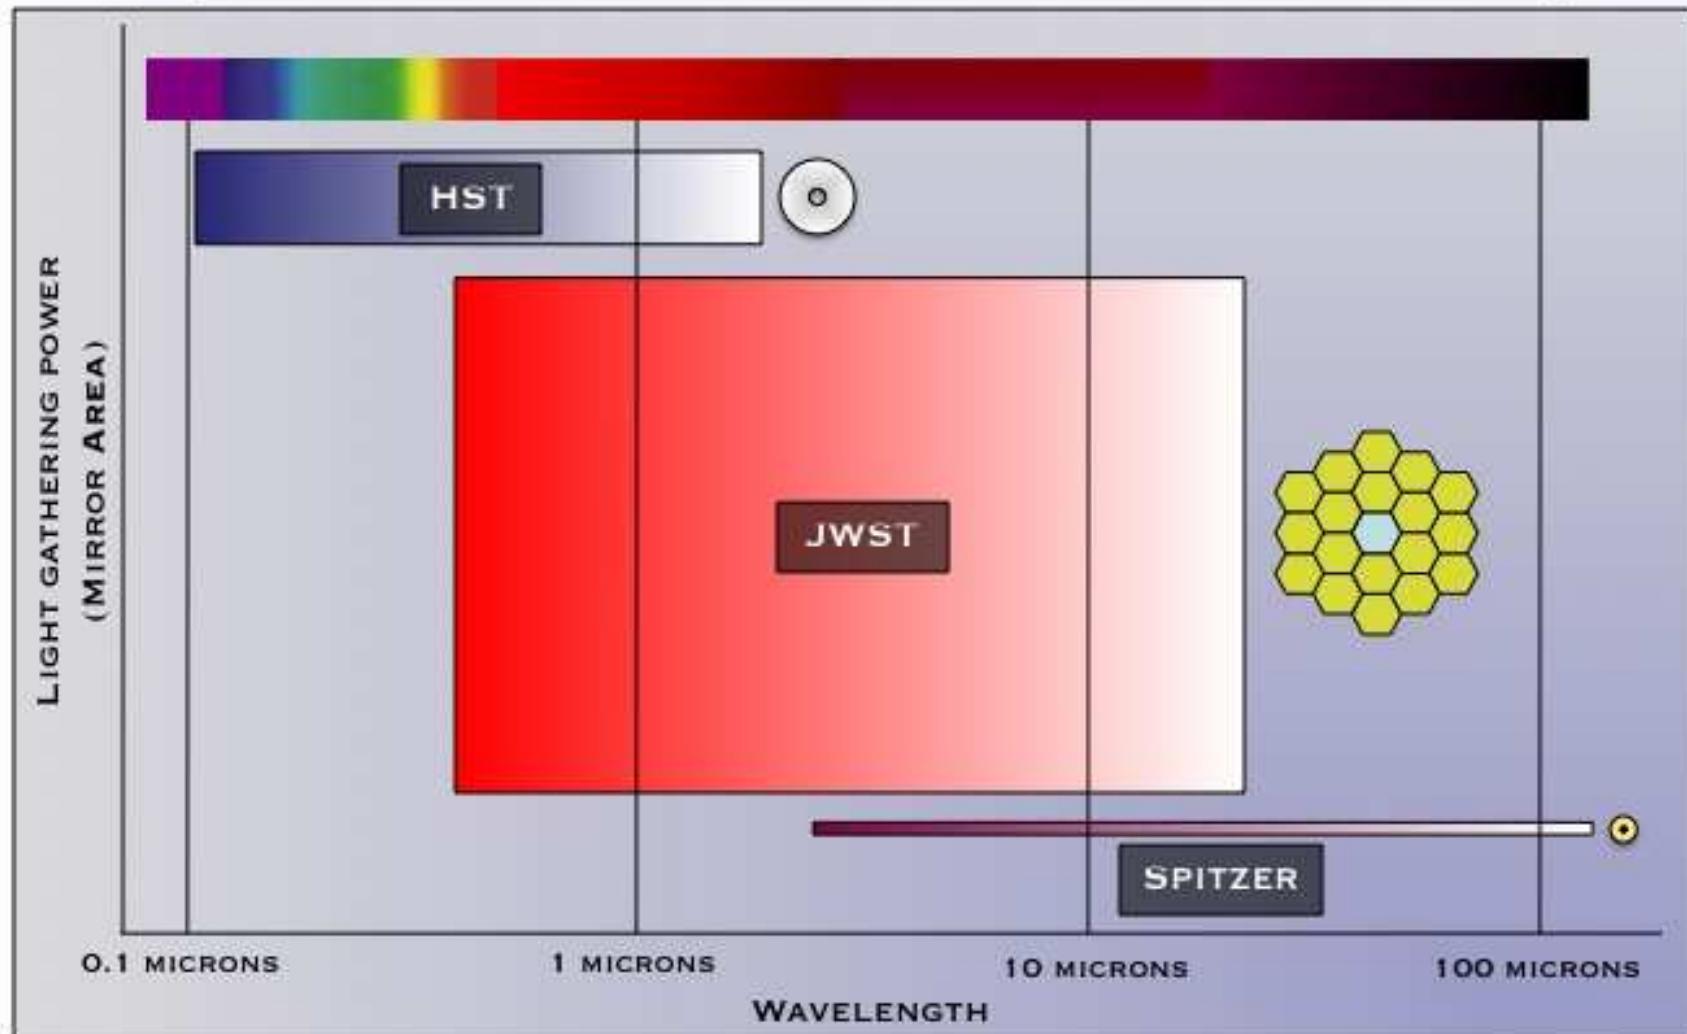

**Hubble primary
mirror**

JWST $\simeq 2.5 \times$ larger than Hubble, so at $\sim 2.5 \times$ larger wavelengths:
JWST has the same resolution in the near-IR as Hubble in the optical.

THE JAMES WEBB SPACE TELESCOPE

LIGHT GATHERING POWER

$$\text{JWST} = 25 \text{ m}^2; \text{ Hubble} = 4.5 \text{ m}^2; \text{ Spitzer} = 0.6 \text{ m}^2$$

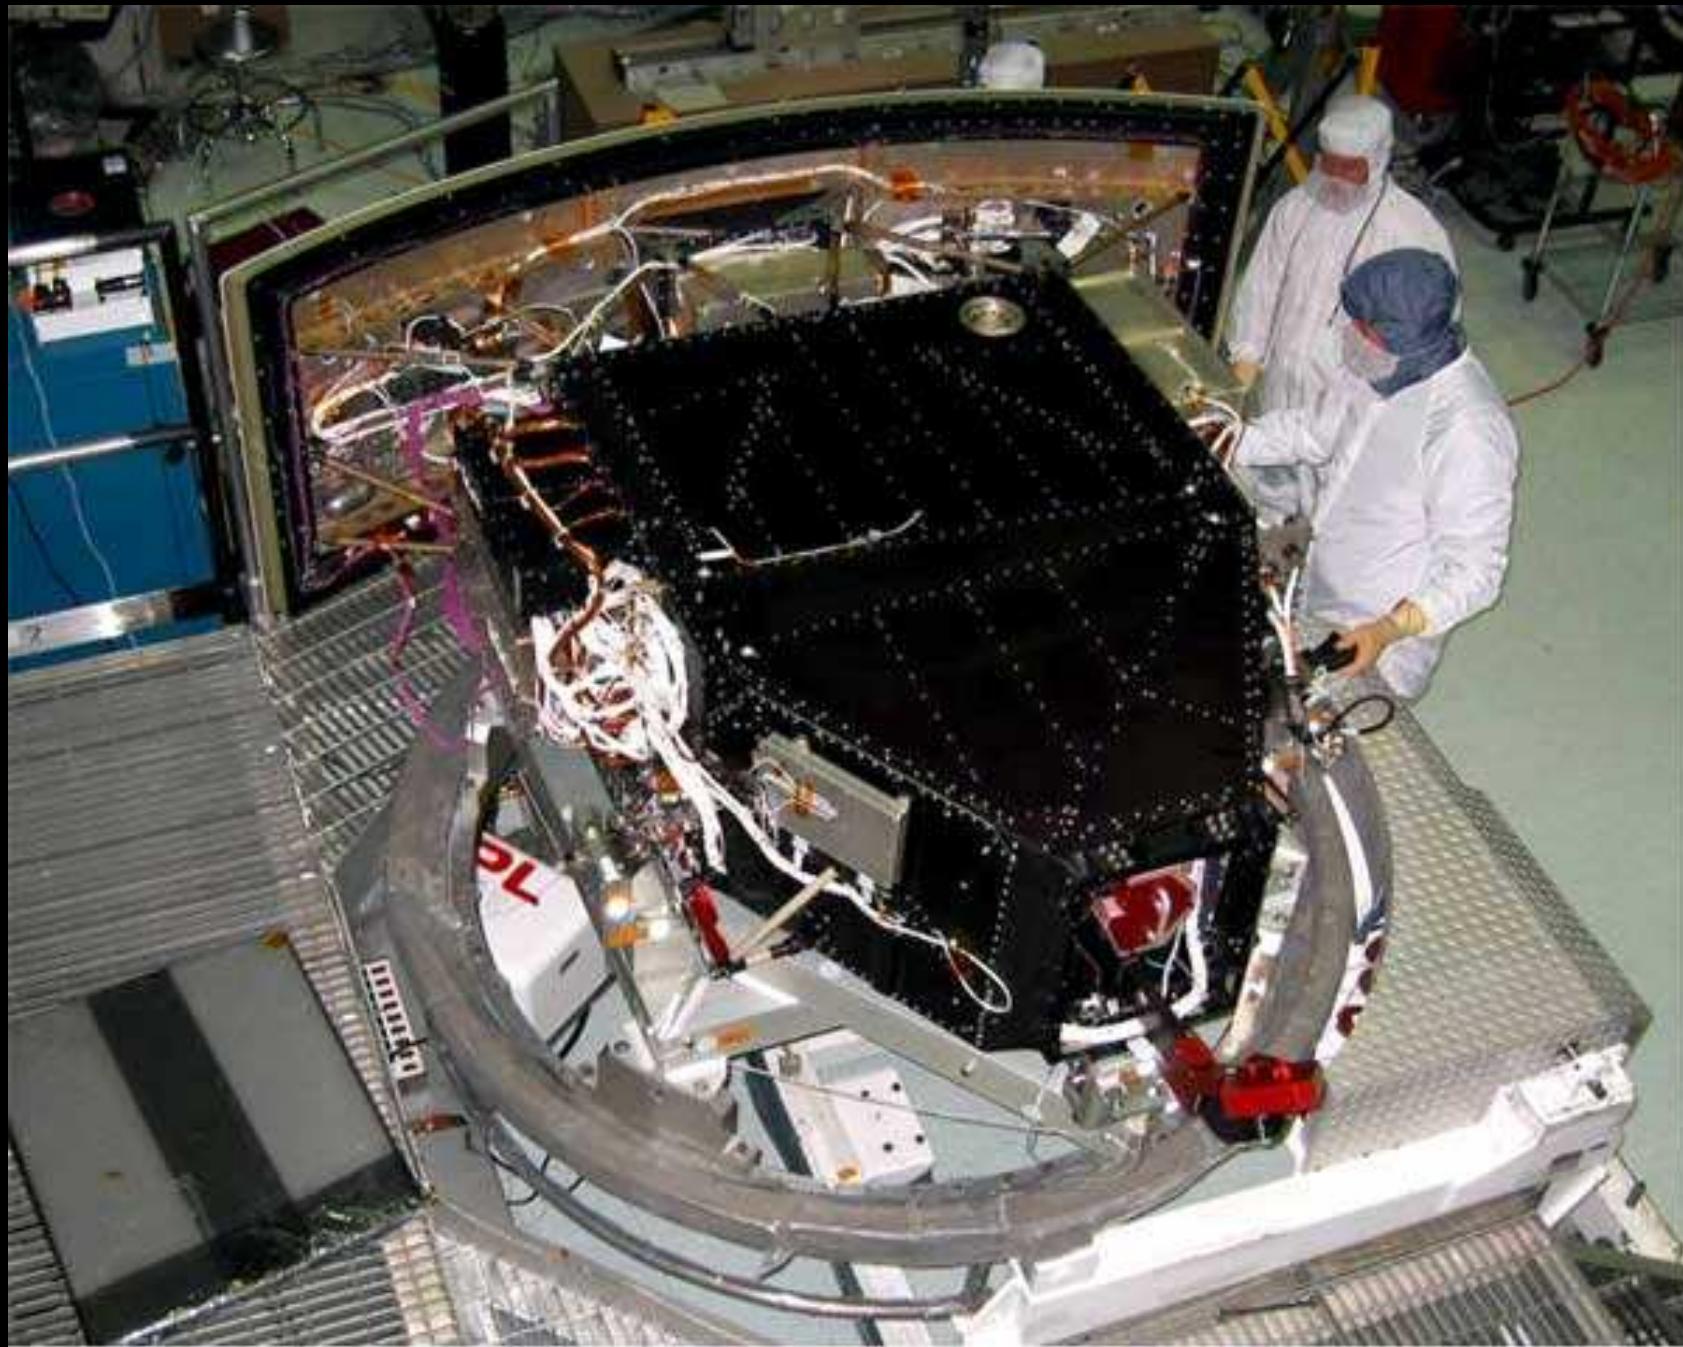

JWST is the perfect near-mid-IR sequel to HST and Spitzer:

- Vastly larger $A(\times\Omega)$ than HST in UV-optical and Spitzer in mid-IR.

(1) Recent key aspects of the Hubble Space Telescope (HST) project:

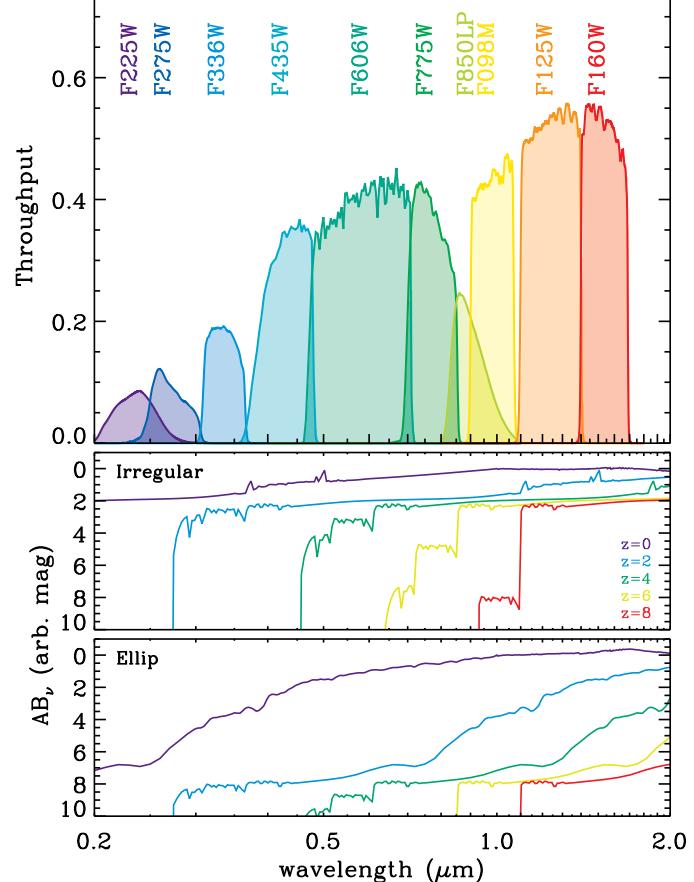

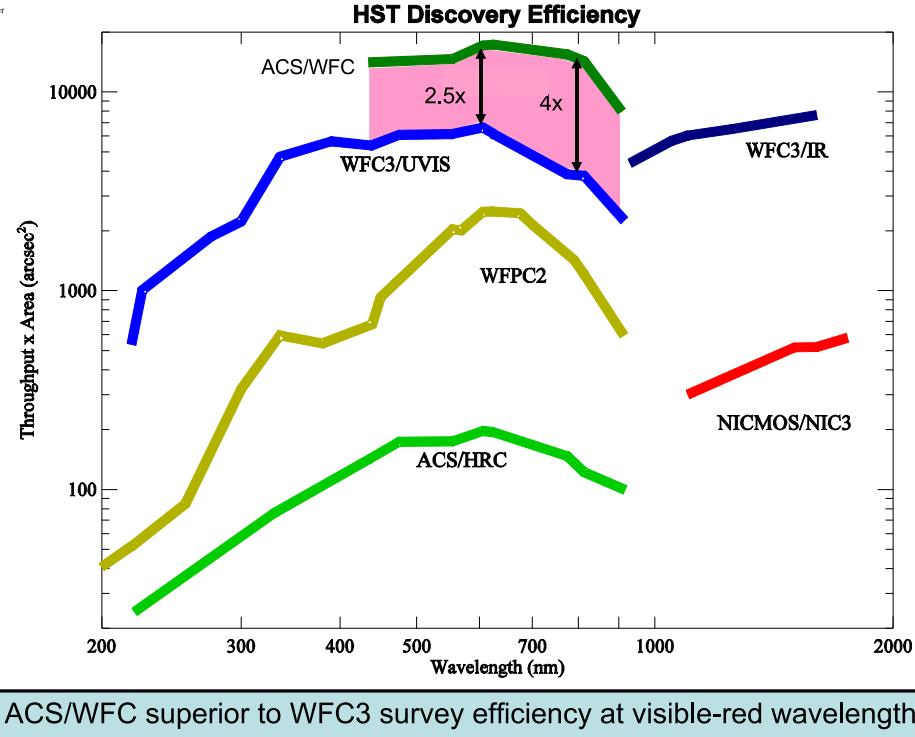

WFC3: Hubble's new Panchromatic High-Throughput Camera

HST WFC3 and its IR channel: a critical pathfinder for JWST science.

Role of ACS in HST Post-SM4 Imaging Capability

WFC3/UVIS channel unprecedented UV–blue throughput & areal coverage:

- QE $\gtrsim 70\%$, $4k \times 4k$ array of $0\farcs04$ pixel, FOV $\simeq 2\farcs67 \times 2\farcs67$.

WFC3/IR channel unprecedented near-IR throughput & areal coverage:

- QE $\gtrsim 70\%$, $1k \times 1k$ array of $0\farcs13$ pixel, FOV $\simeq 2\farcs25 \times 2\farcs25$.

\Rightarrow WFC3 opened major new parameter space for astrophysics in 2009:

WFC3 filters designed for star-formation and galaxy assembly at $z \simeq 1\text{--}8$.

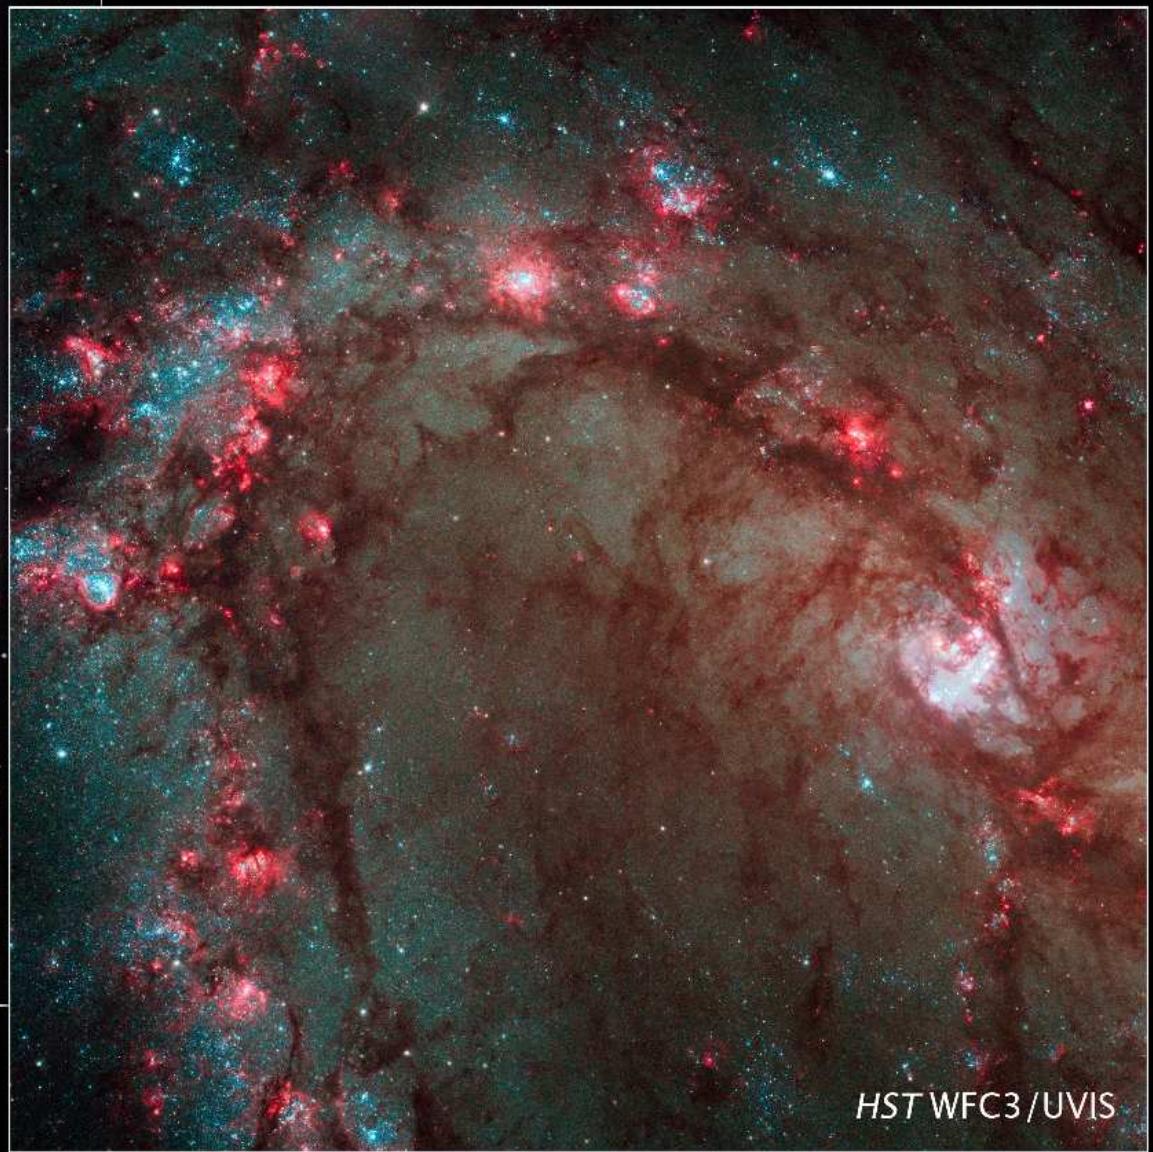

- HST WFC3 and its IR channel a critical pathfinder for JWST science.

(2) Measuring Galaxy Assembly and Supermassive Black-Hole Growth.

One of the remarkable HST discoveries was how numerous and small faint galaxies are: The building blocks of giant galaxies seen today.

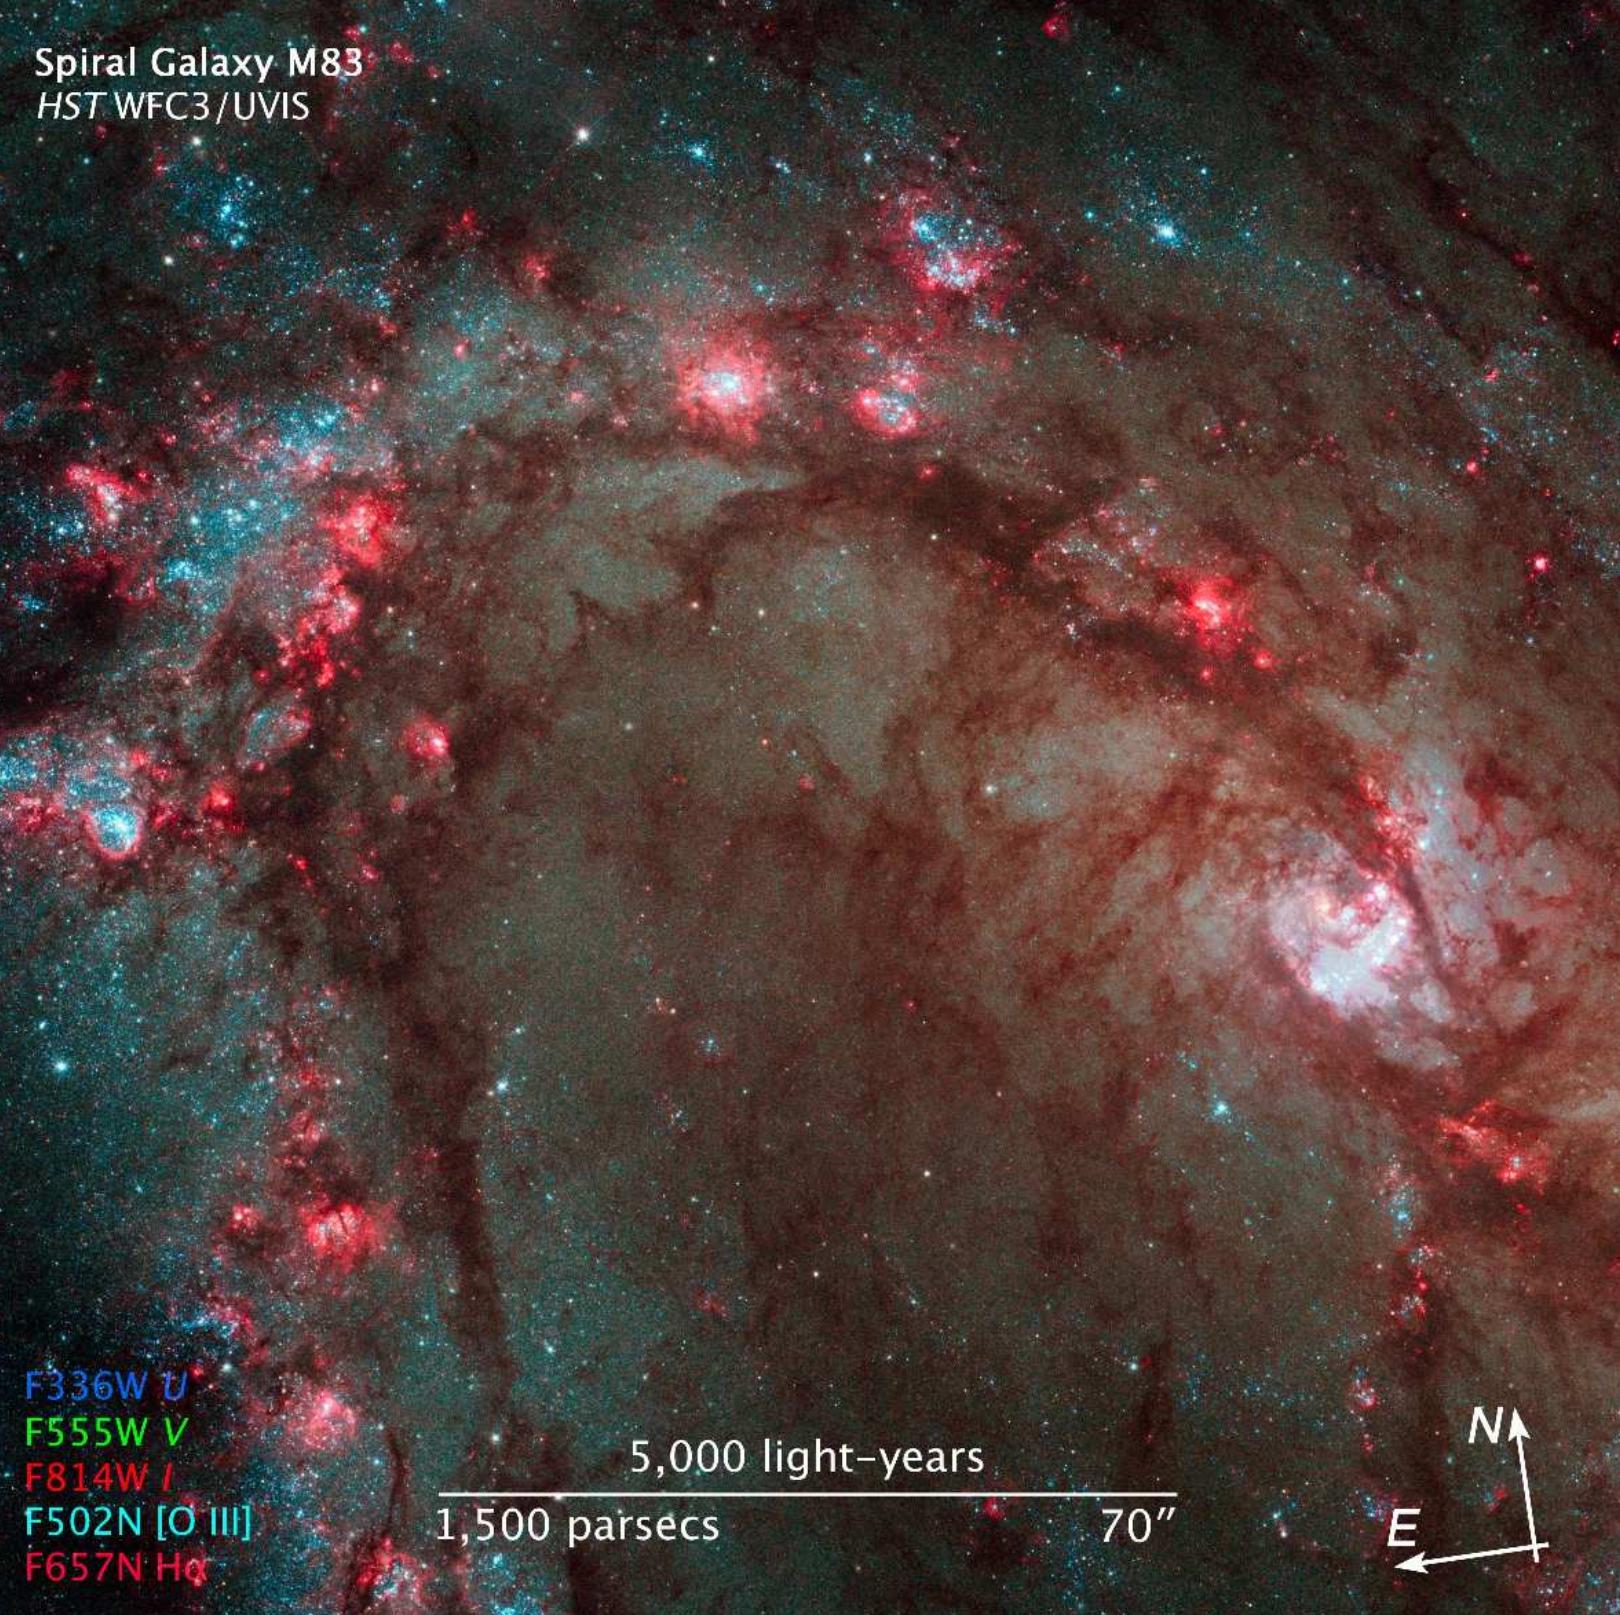

H. Kim (2012 ApJS & Dissertation)

Spiral Galaxy M83
Hubble Space Telescope • WFC3/UVIS

Spiral Galaxy M83

HST WFC3/UVIS

F336W *U*

F555W *V*

F814W *I*

F502N [O III]

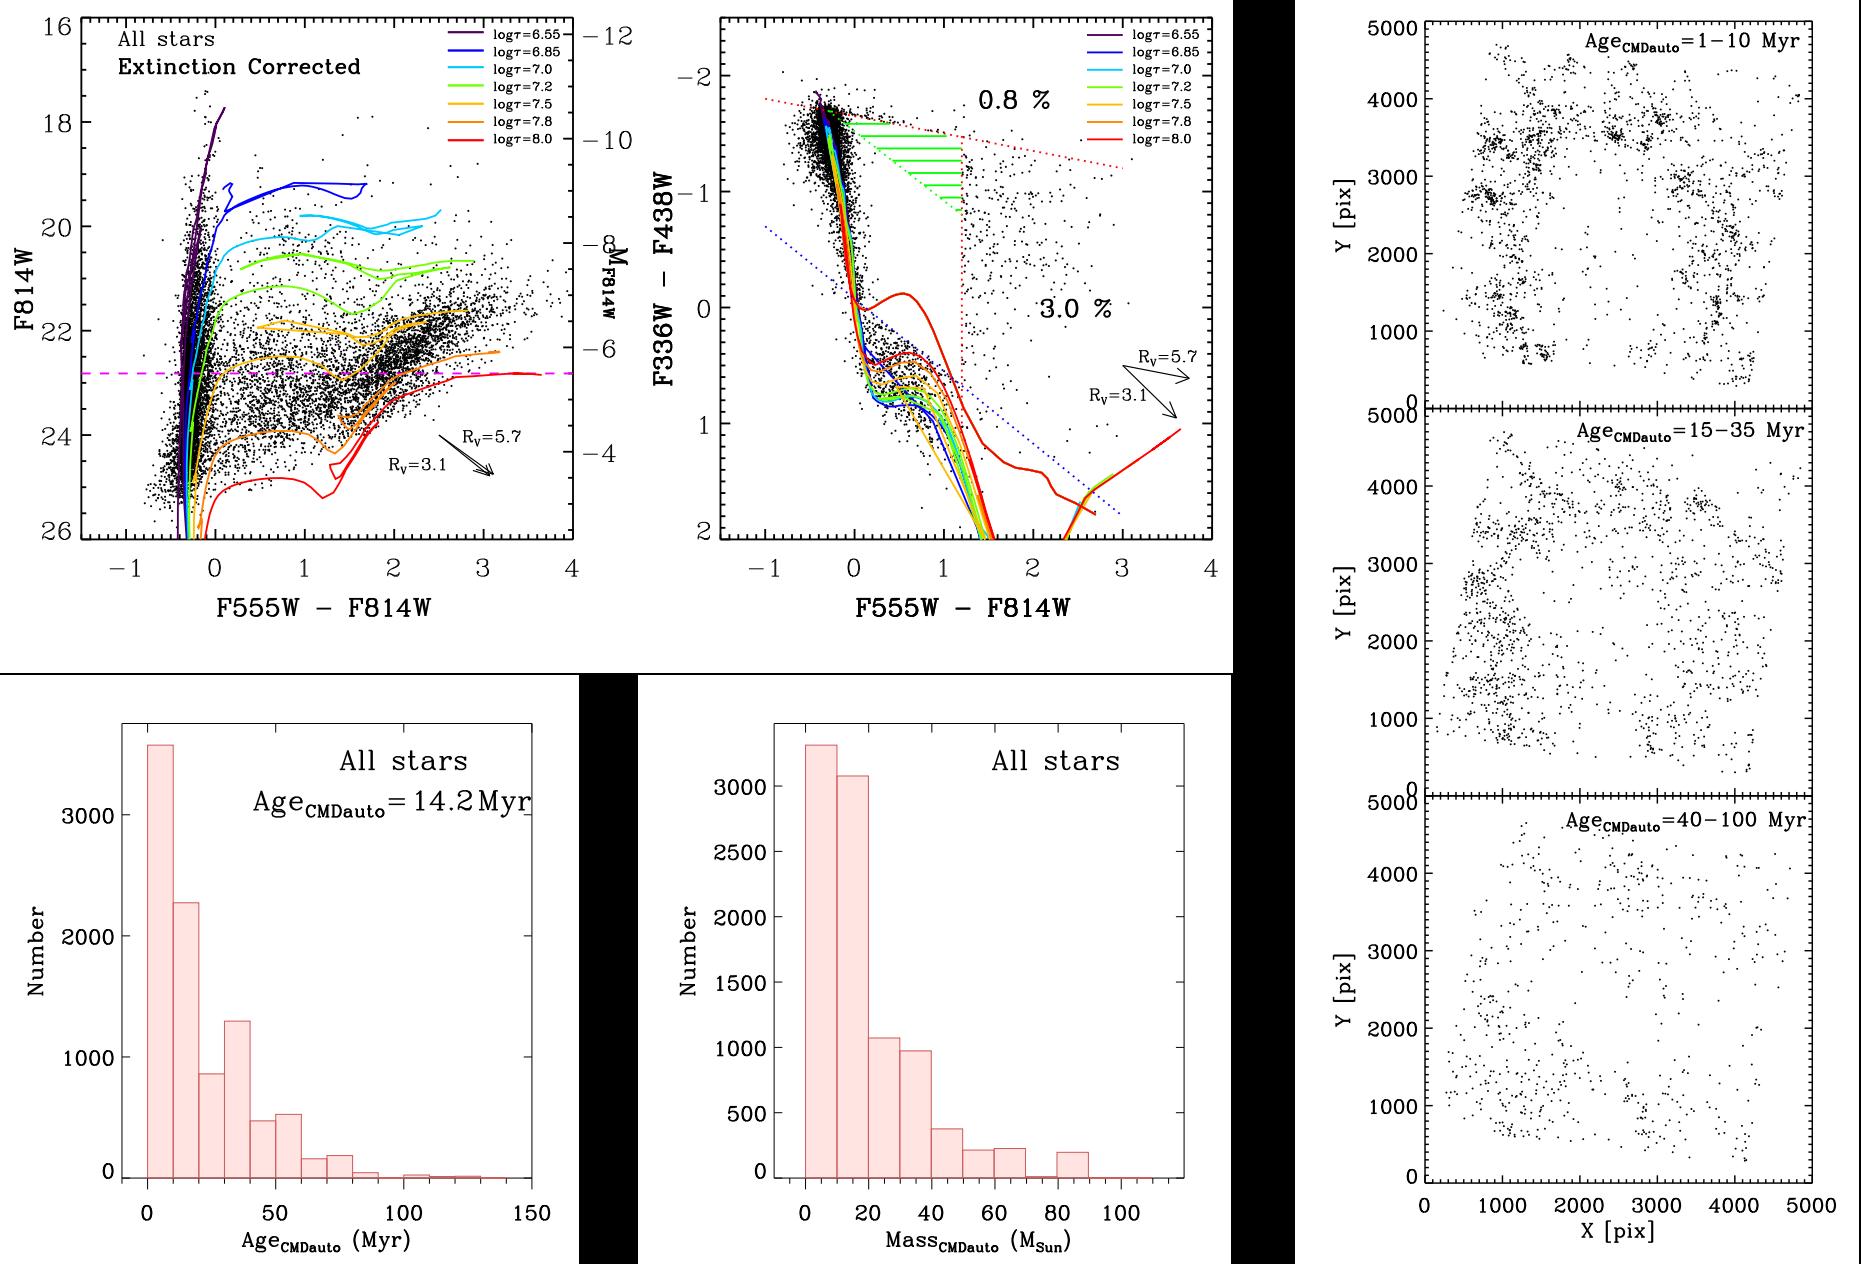

F657N H α

5,000 light-years

1,500 parsecs

70"

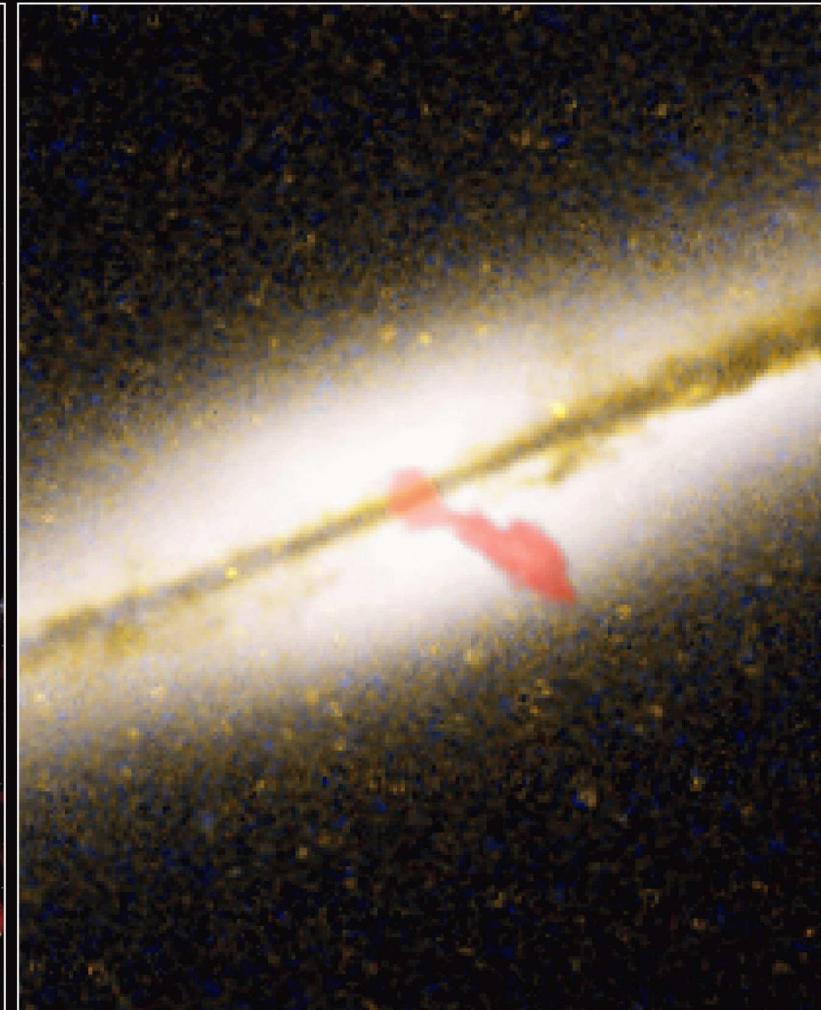

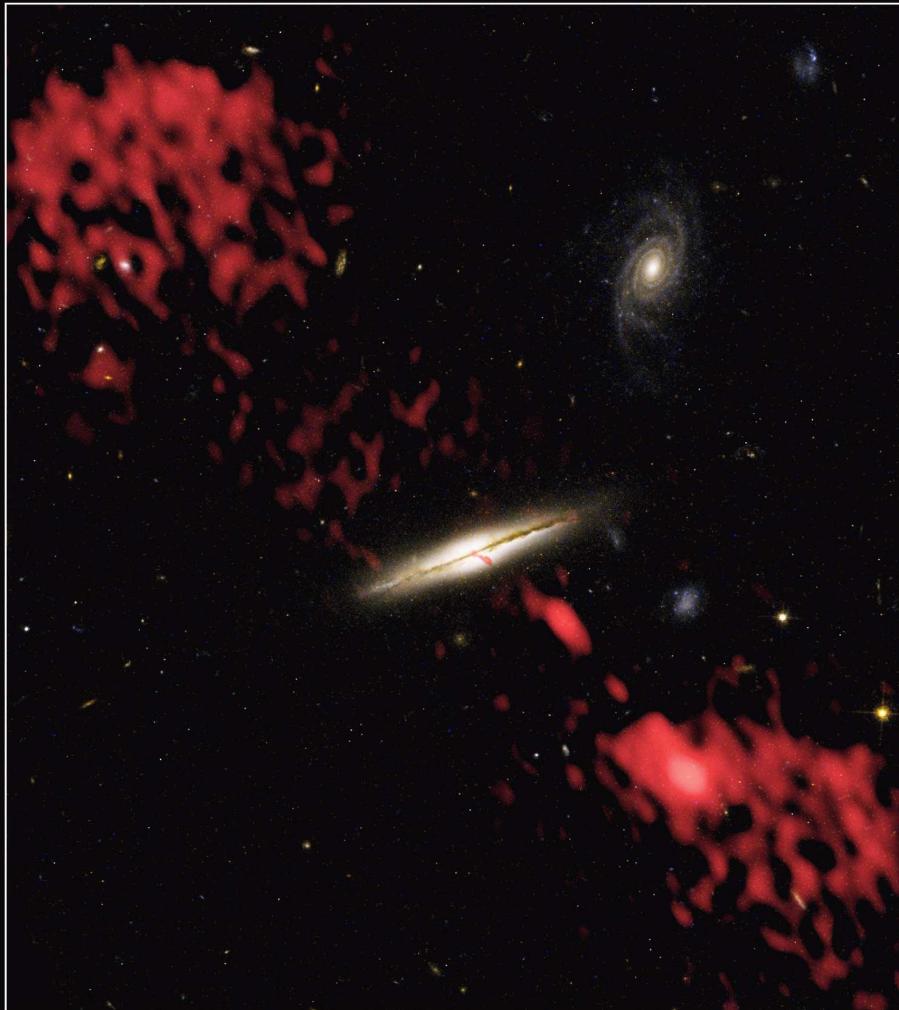

N
E

Well determined dust-corrected ages for stars in M83, with formation and dissipation along/across spiral arms (Hwihyun Kim et al. 2012, ApJS).

JWST can do this in much dustier environments and for older stellar populations. But must do all we can with HST in UV-blue before JWST flies!

(2) Measuring Galaxy Assembly & Supermassive Blackhole Growth

Radio Galaxy 0313-192
Hubble Space Telescope ACS WFC • Very Large Array

NASA, NRAO/AUI/NSF and W. Keel (University of Alabama) • STScI-PRC03-04

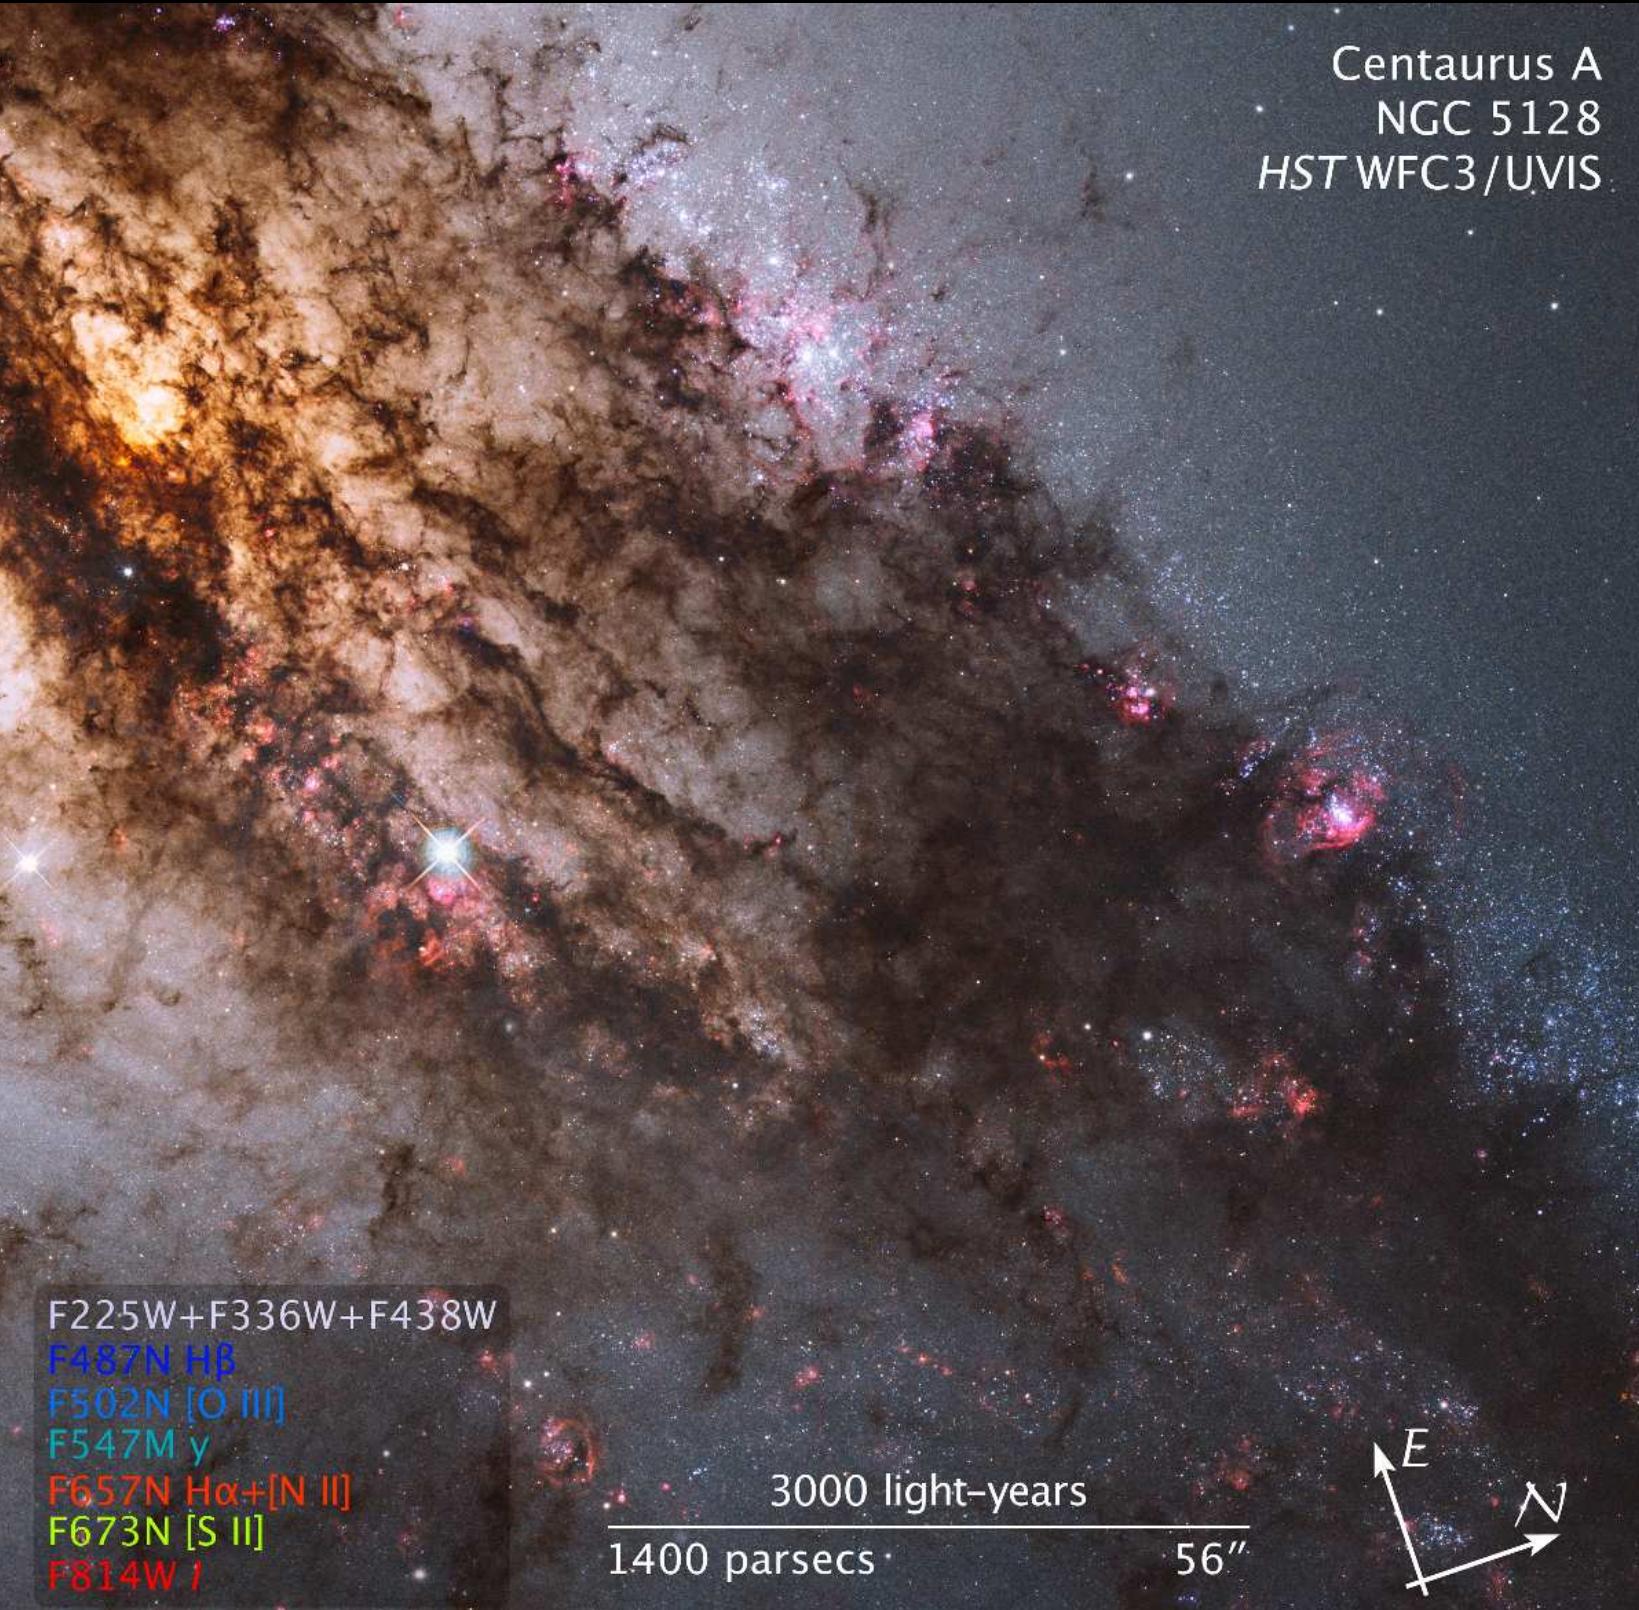

Does galaxy assembly go hand-in-hand with supermassive blackhole growth?

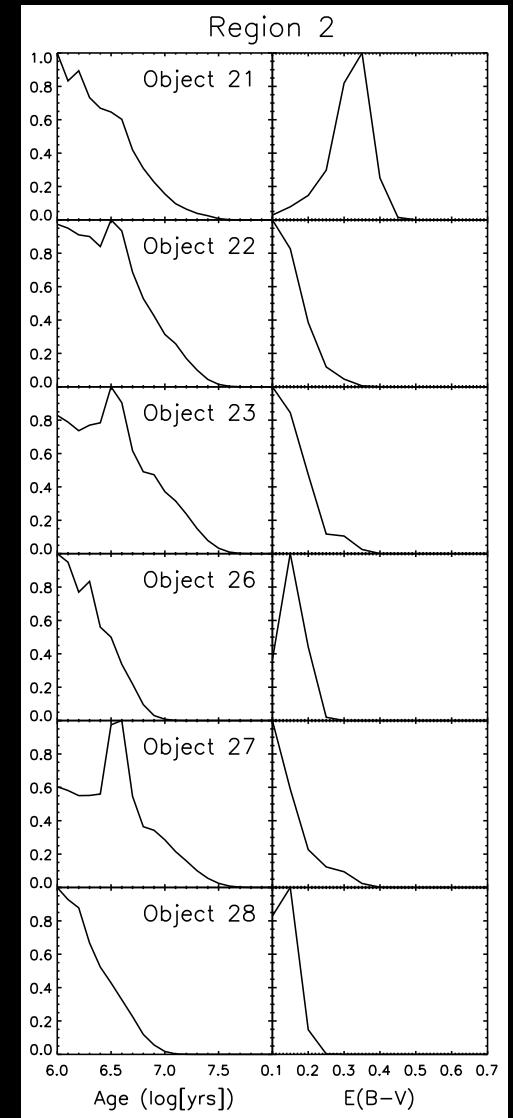

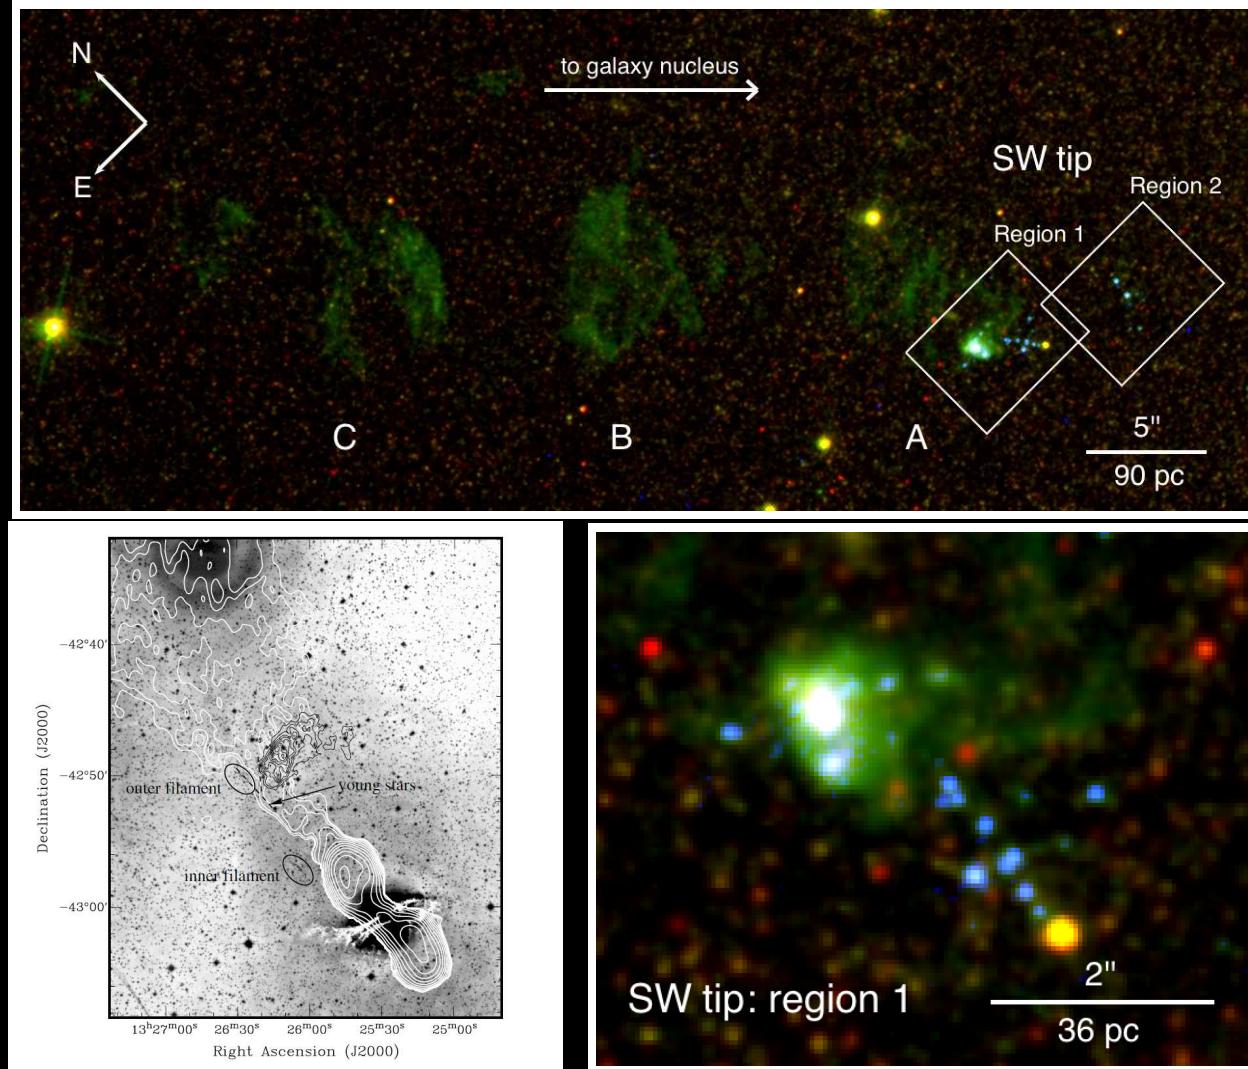

"For God's sake, Edwards. Put the laser pointer away."

The danger of having Quasar-like devices too close to home ...

Centaurus A
NGC 5128
HST WFC3/UVIS

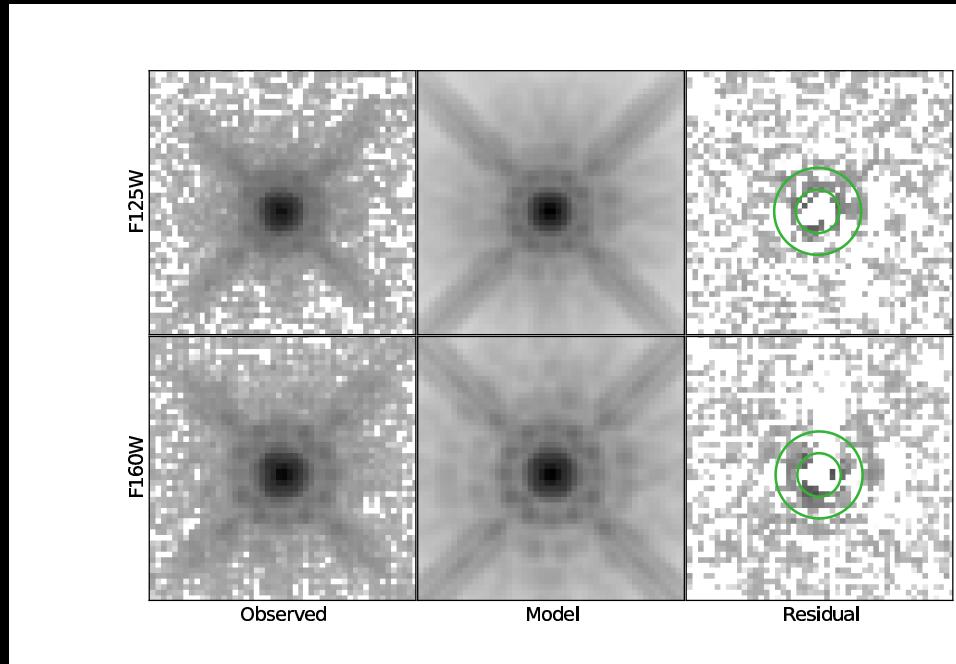

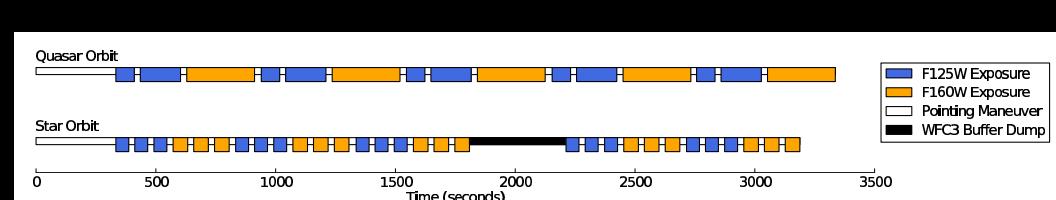

Well determined ages for young (~ 2 Myr) stars in Centaurus A jet, with star-formation in jet's wake (Crockett et al. 2012, MNRAS, 421, 1602).

JWST can do this in much dustier environments (and for older stars). We must do all we can with HST in UV-blue before JWST flies.

HST WFC3 observations of Quasar Host Galaxies at $z \simeq 6$ (age ~ 1 Gyr)

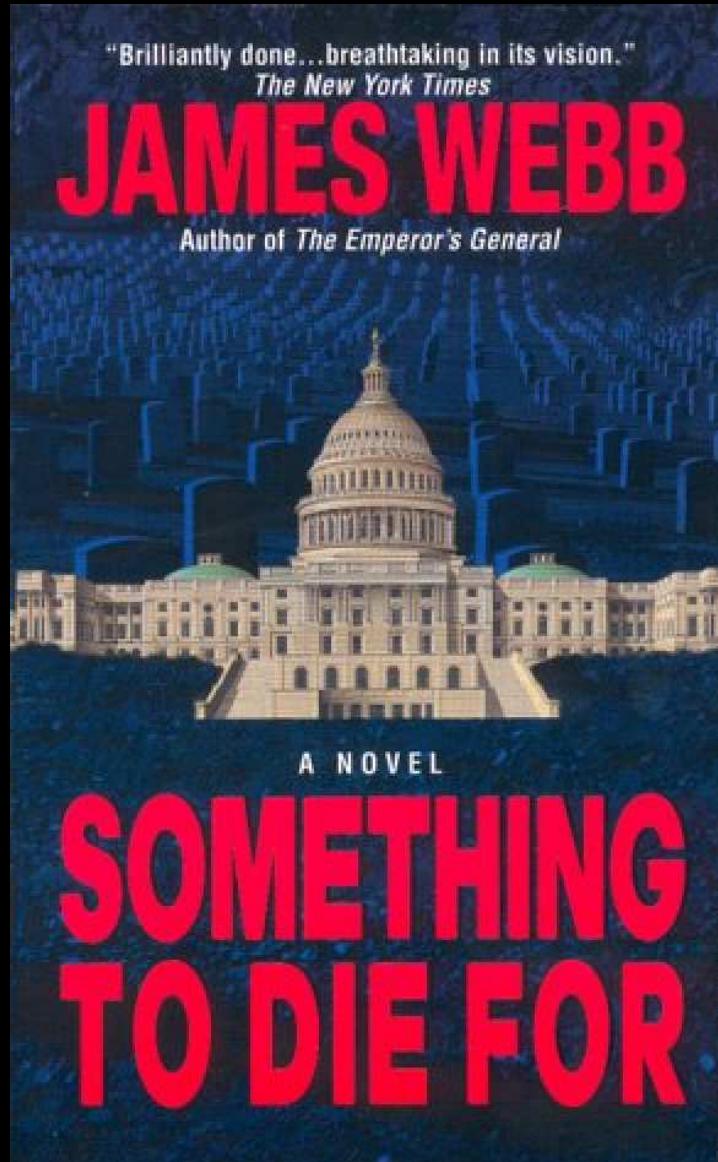

- Careful contemporaneous orbital PSF-star subtraction: Removes most of HST “OTA spacecraft breathing” effects (Mechtley et al. 2012).
- PSF-star ($AB=15$ mag) subtracts Quasar (18.5 mag) nearly to the noise limit: NO host galaxy detected $100\times$ fainter ($AB \gtrsim 23.5$ mag at $r \gtrsim 0'3$).

THE most luminous Quasars in the Universe: Are all their host galaxies faint? \Rightarrow Major implications for Galaxy Assembly–SMBH Growth.

- JWST Coronagraphs can do this $10\text{--}100\times$ fainter (and for $z \lesssim 20$) — but need JWST diffraction limit at $2.0\mu\text{m}$ and clean PSF to do this.

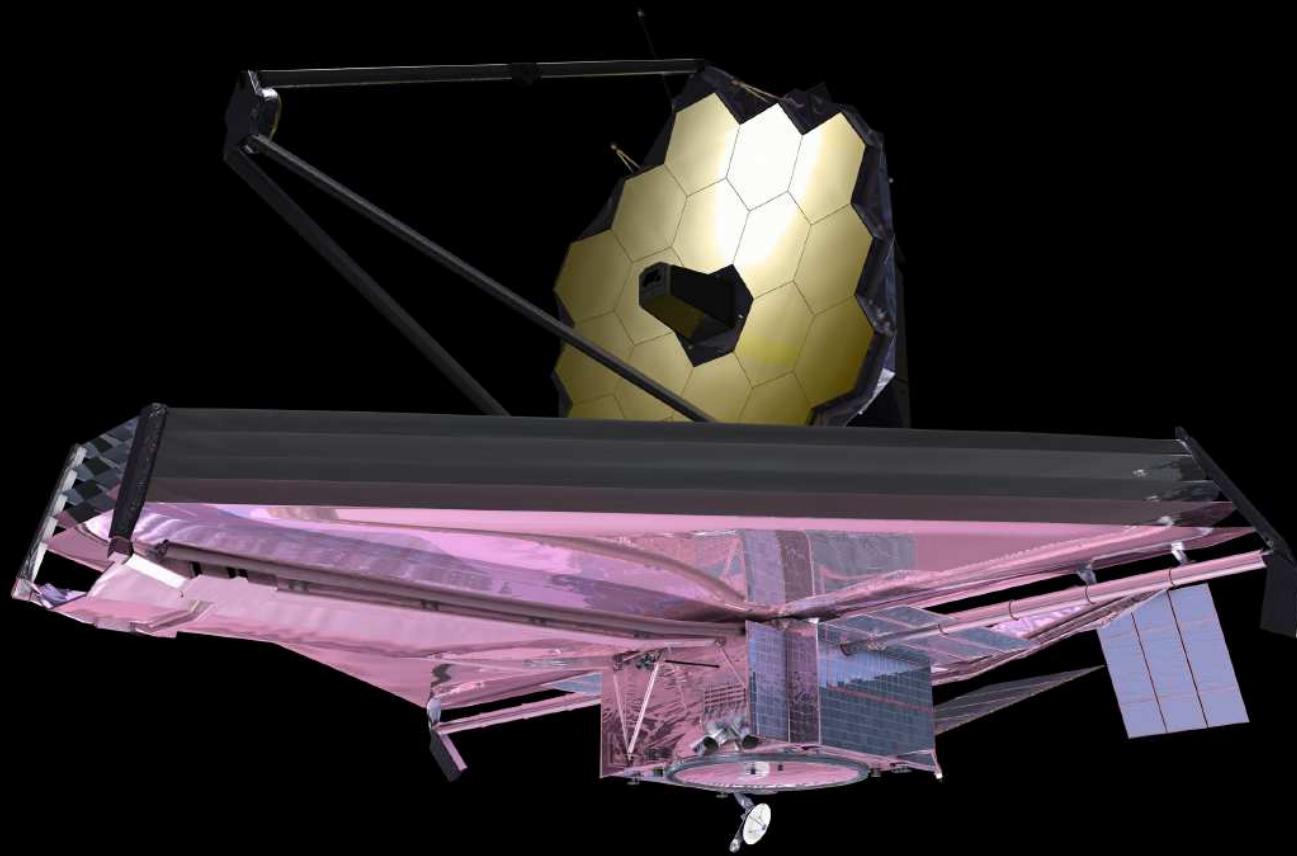

(3) What is the James Webb Space Telescope (JWST)?

To be used by students & scientists after 2018 ... It'll be worth it.

(RIGHT) Life-size JWST prototype on the Capitol Mall, May 2007.

(3) What is the James Webb Space Telescope (JWST)?

- A fully deployable 6.5 meter (25 m^2) segmented IR telescope for imaging and spectroscopy at $0.6\text{--}28 \mu\text{m}$ wavelength, to be launched in Fall 2018.
- Nested array of sun-shields to keep its ambient temperature at 40 K, allowing faint imaging (AB=31.5 mag) and spectroscopy.

THE JAMES WEBB SPACE TELESCOPE

JWST LAUNCH

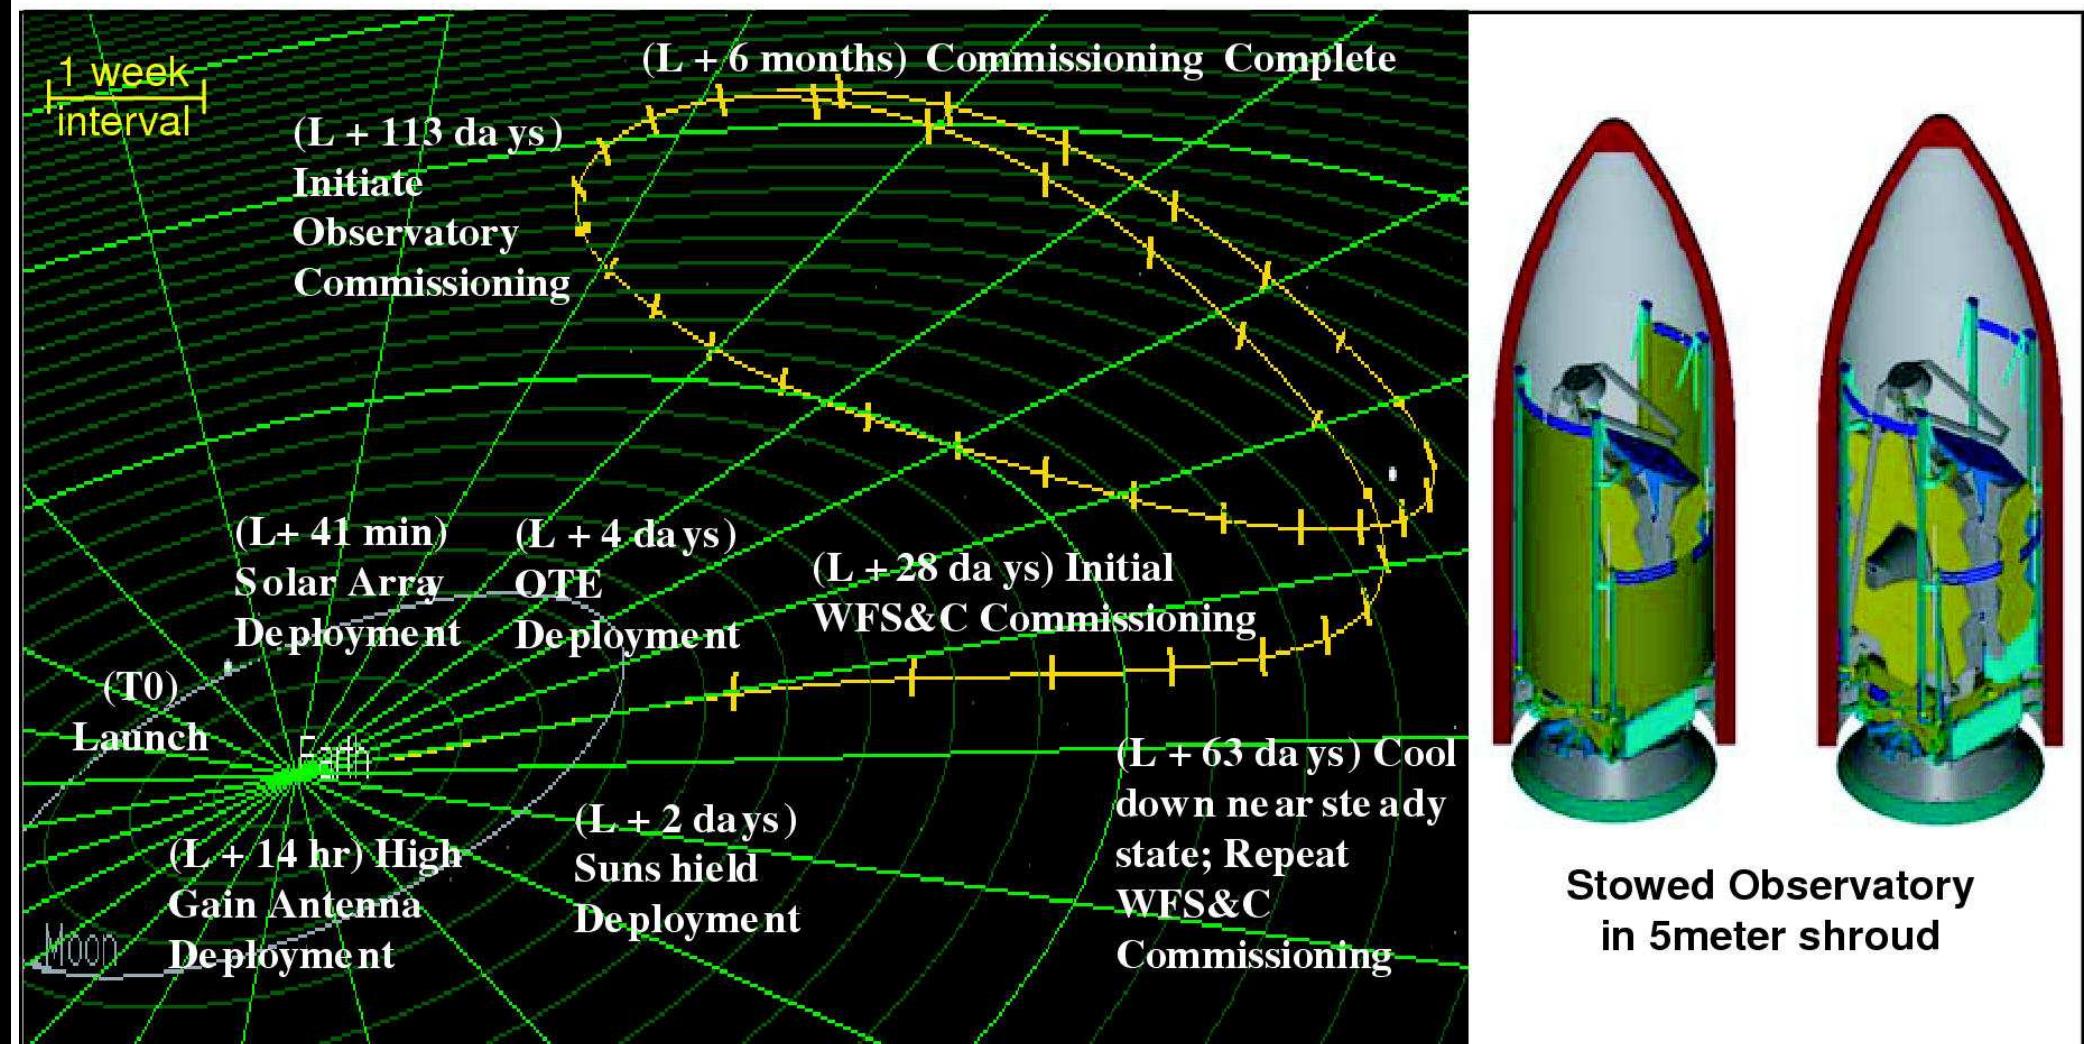

- LAUNCH VEHICLE IS AN ARIANE 5 ROCKET, SUPPLIED BY ESA
- SITE WILL BE THE ARIANESPACE'S ELA-3 LAUNCH COMPLEX NEAR KOUROU, FRENCH GUIANA

ARIANESPACE - ESA - NASA

- The JWST launch weight will be $\lesssim 6500$ kg, and it will be launched to L2 with an ESA Ariane-V launch vehicle from Kourou in French Guiana.

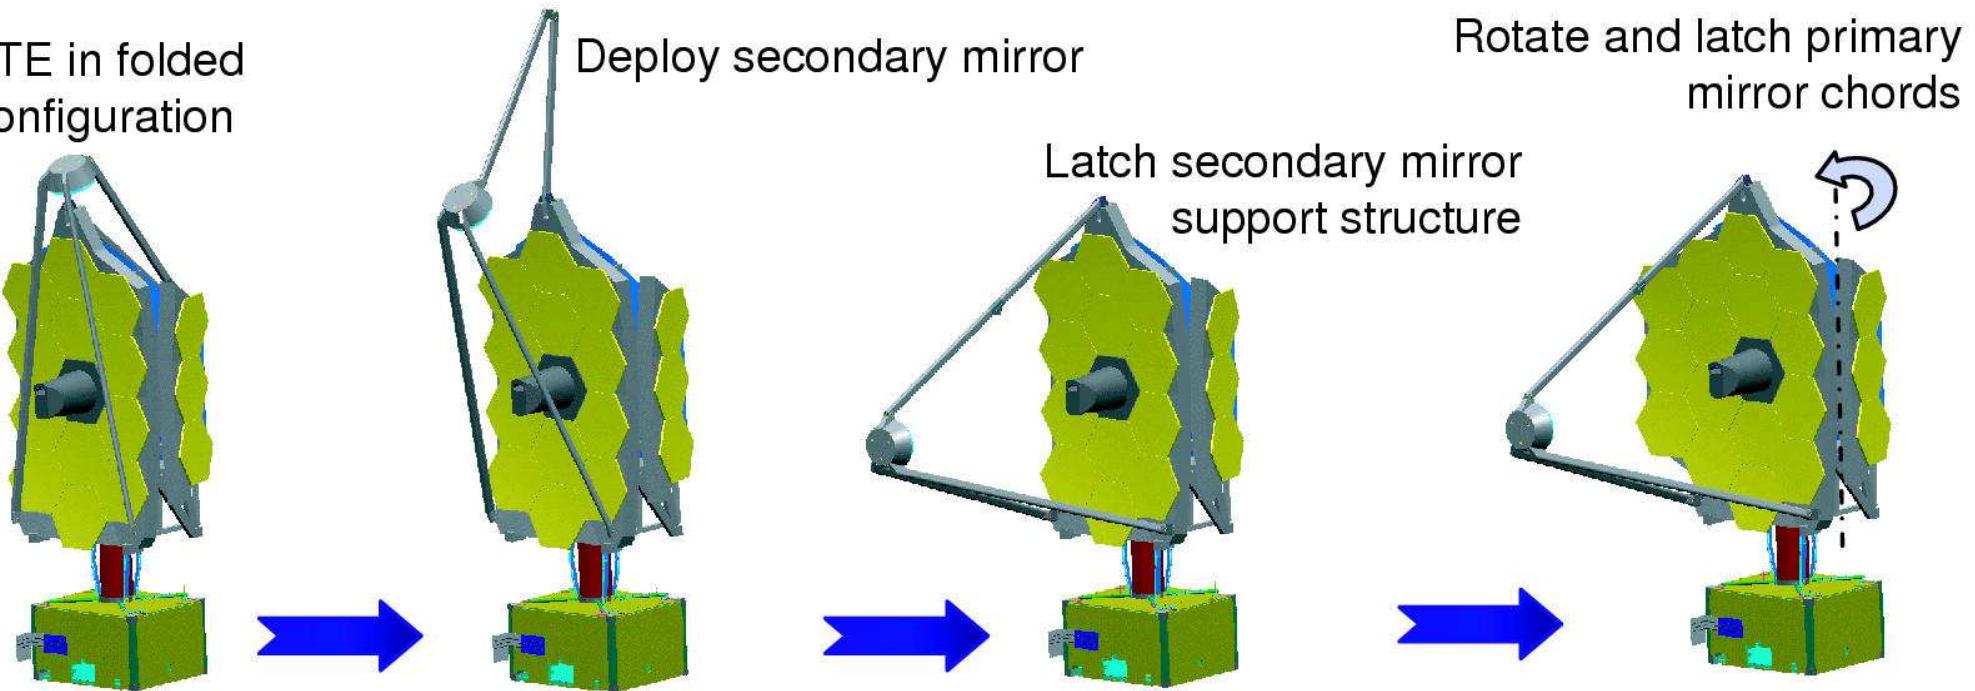

(3a) How will JWST travel to its L2 orbit?

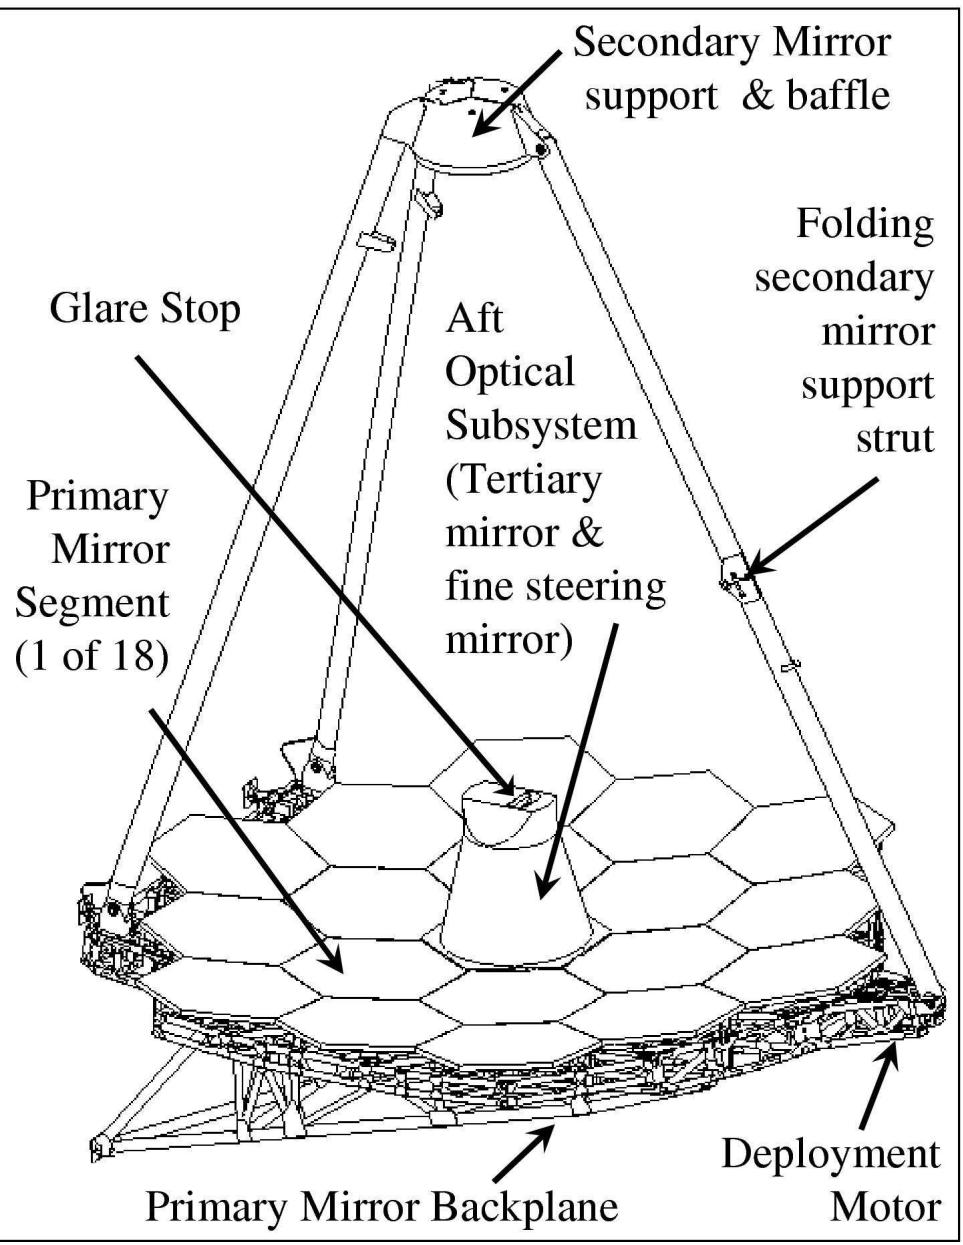

- After launch in 2018 with an ESA Ariane-V, JWST will orbit around the Earth–Sun Lagrange point L2, 1.5 million km from Earth.
- JWST can cover the whole sky in segments that move along with the Earth, observe $\gtrsim 70\%$ of the time, and send data back to Earth every day.

- (3b) How will JWST be automatically deployed?

OTE in folded configuration

- During its two month journey to L2, JWST will be automatically deployed, its instruments will be cooled, and be inserted into an L2 orbit.
- The entire JWST deployment sequence will be tested several times on the ground — but only in 1-G: Component and system tests in Houston.
- Component fabrication, testing, & integration is on schedule: 18 out of 18 flight mirrors completely done, and meet the 40K specifications.

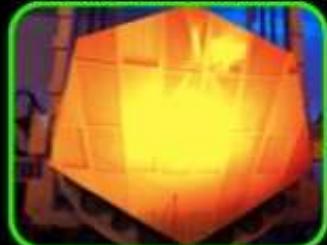

Wave-Front Sensing tested hands-off at 40 K in 1-G at JSC in 2015-2016.

Ball 1/6 scale-model for WFS: produces diffraction-limited 2.0 μm images.

Full-scale JWST mockup with sunshield pallette

Telescope Assembly Ground Support Equipment

Hardware has been installed at GSFC approximately 8 weeks ahead of schedule

(3b) JWST instrument update: US (UofA, JPL), ESA, & CSA.

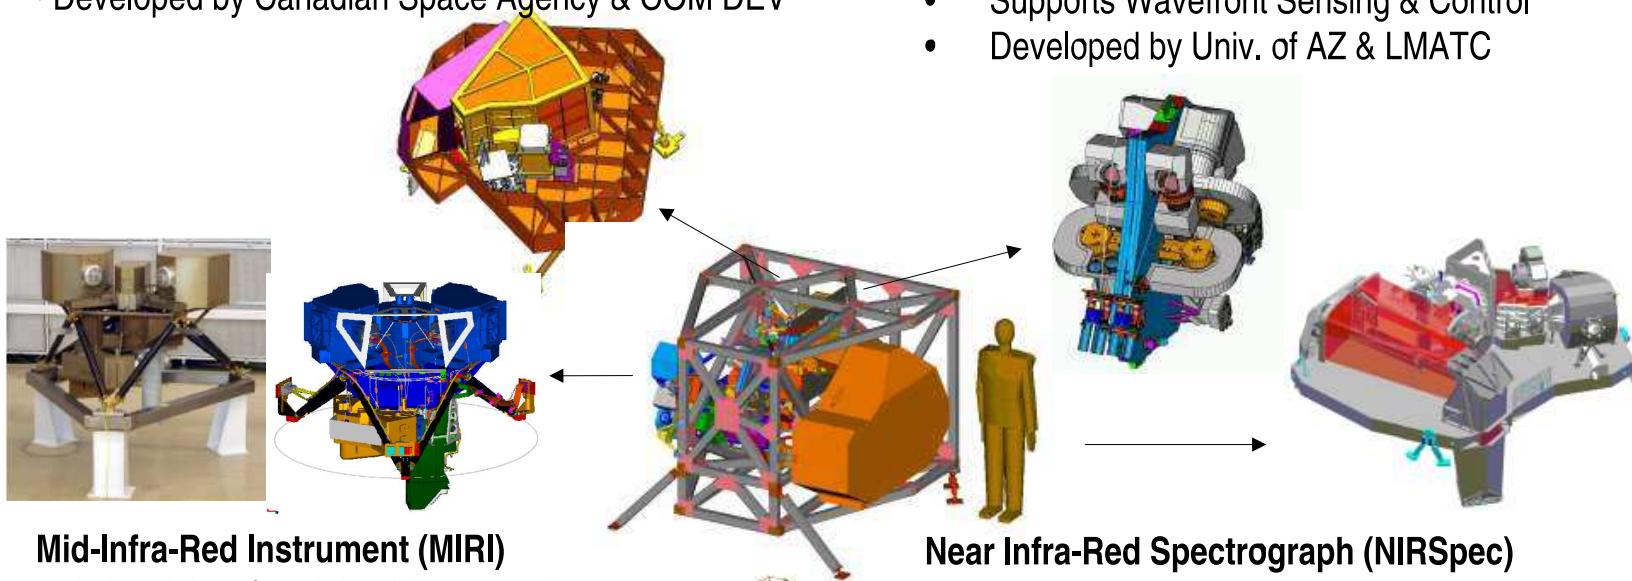

Instrument Overview

Fine Guidance Sensor (FGS)

- Ensures guide star availability with >95% probability at any point in the sky
- Includes Narrowband Imaging Tunable Filter
- Developed by Canadian Space Agency & COM DEV

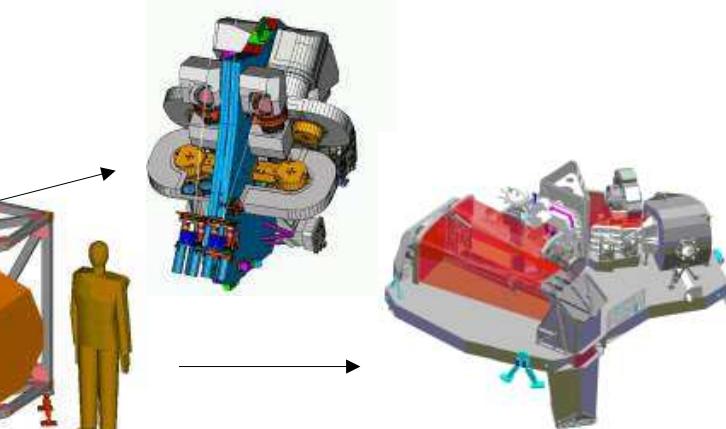

Mid-Infra-Red Instrument (MIRI)

- Distinguishes first light objects; studies galaxy evolution; explores protostars & their environs
- Imaging and spectroscopy capability
- 5 to 27 microns
- Cooled to 7K by Cyro-cooler
- Combined European Consortium/JPL development

Near Infra-Red Camera (NIRCam)

- Detects first light galaxies and observes galaxy assembly sequence
- 0.6 to 5 microns
- Supports Wavefront Sensing & Control
- Developed by Univ. of AZ & LMATC

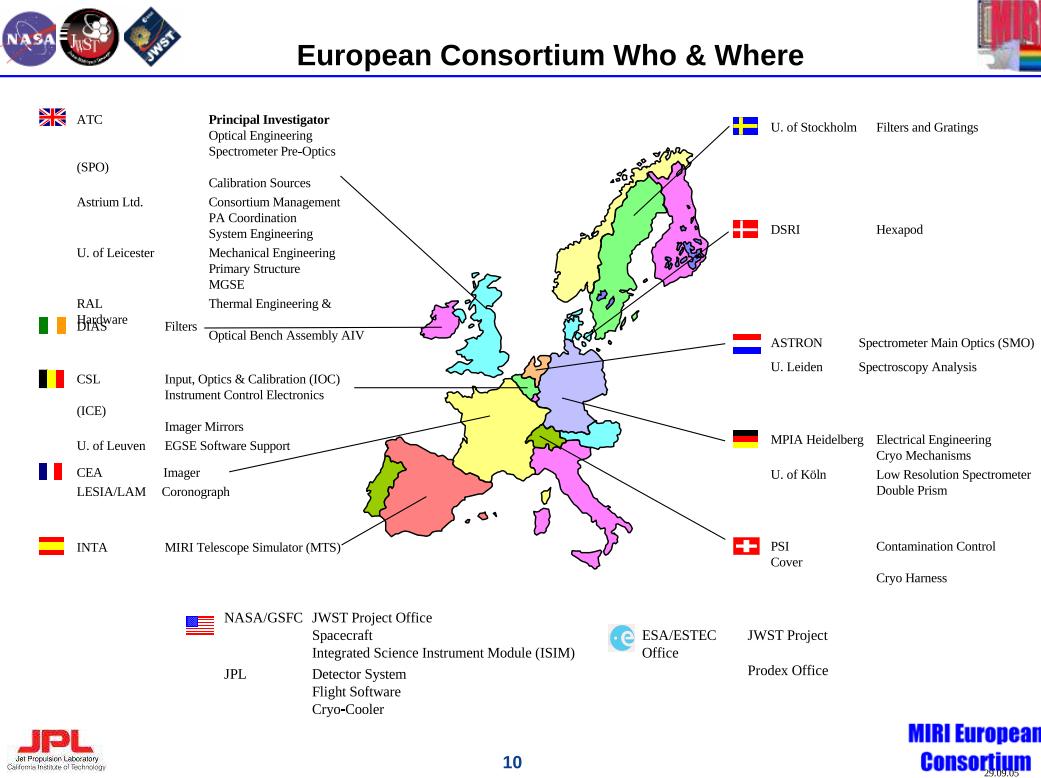

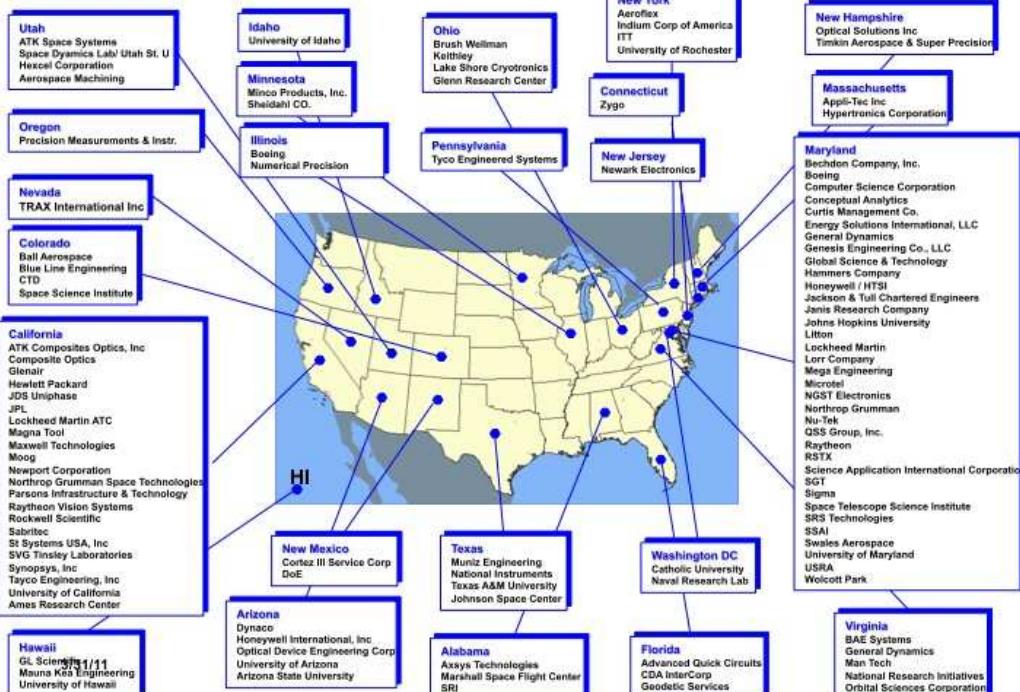

Near Infra-Red Spectrograph (NIRSpec)

- Measures redshift, metallicity, star formation rate in first light galaxies
- 0.6 to 5 microns
- Simultaneous spectra of >100 objects
- Developed by ESA & EADS with NASA/GSFC Detector & Microshutter Subsystems

MIRI delivery 05/12; NIRCam 09/12; NIRSpec & FGS early 2013.

JWST: A Product of the Nation

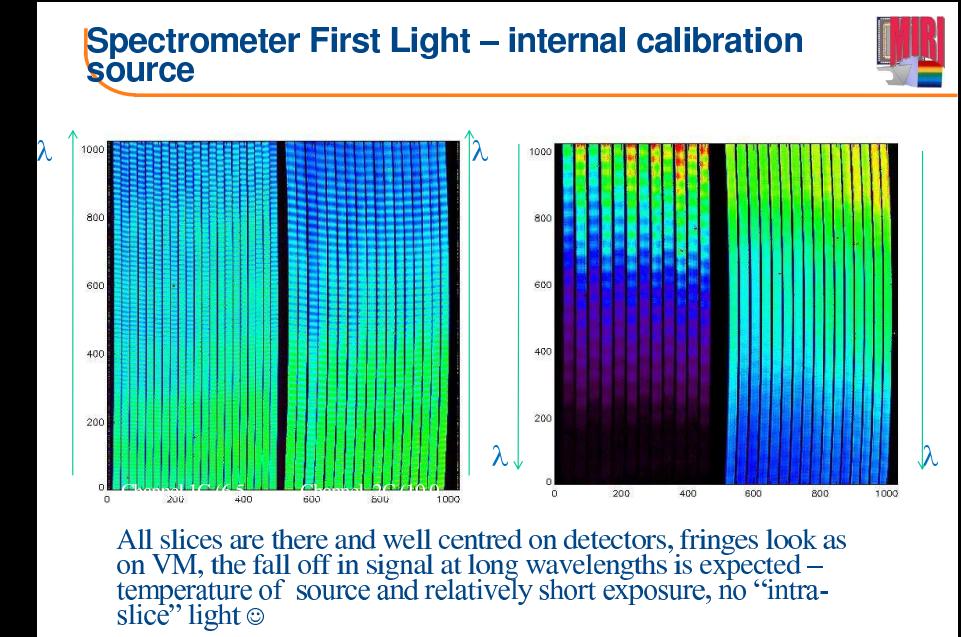

- JWST hardware made in 27 US States: $\gtrsim 75\%$ of launch-mass finished.
- Ariane V Launch & NIRSpec provided by ESA; & MIRI by ESA & JPL.
- JWST Fine Guider Sensor + NIRISS provided by Canadian Space Agency.
- JWST NIRCam made by UofA and Lockheed.

Flight MIRI

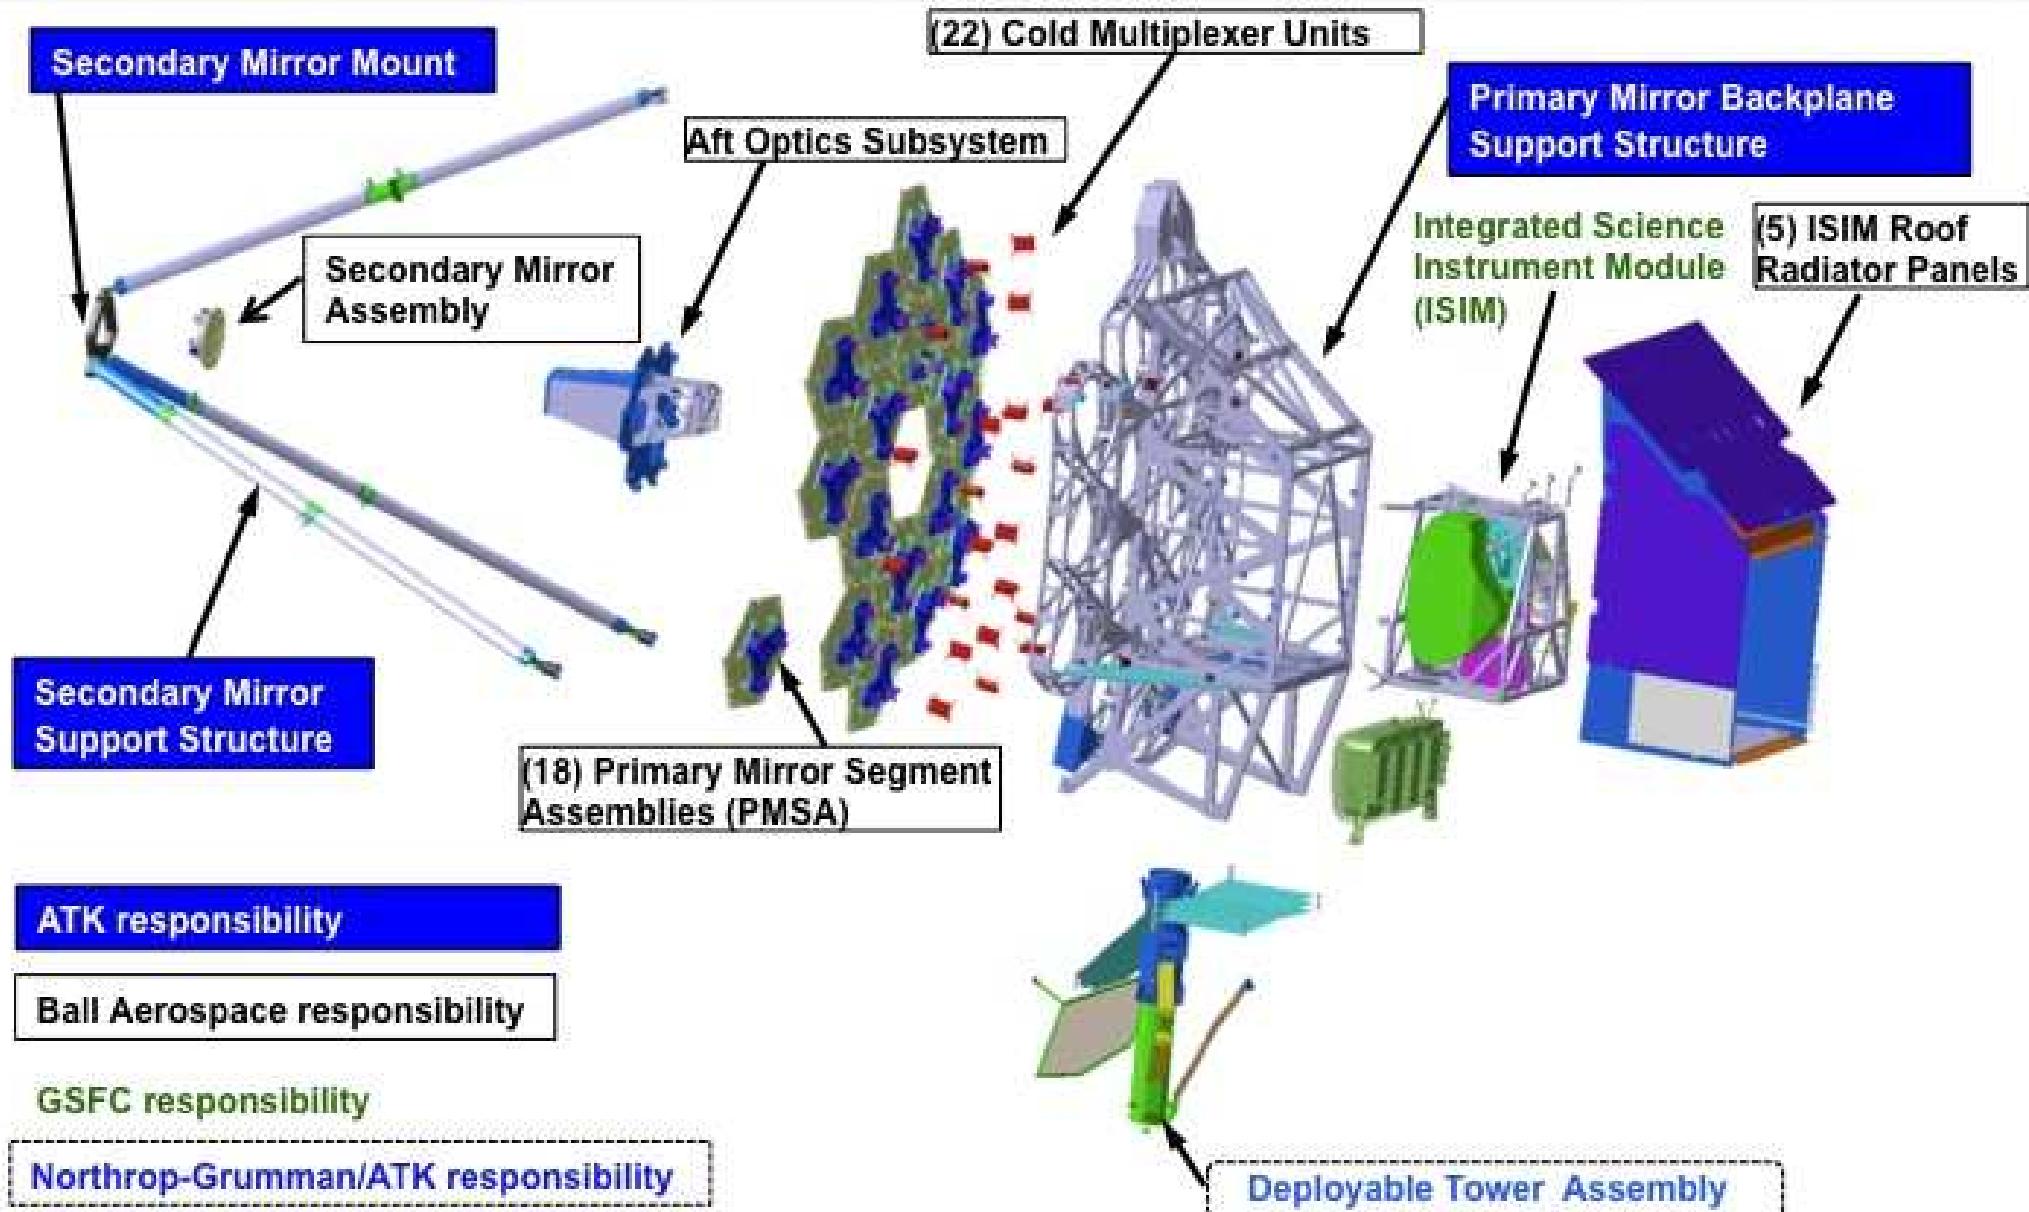

JWST's mid-infrared ($5\text{--}29\mu\text{m}$) camera and spectrograph:

- MIRI — built by ESA consortium of 10 ESA countries & NASA JPL.
- Flight build completed and tested with First Light in July 2011.

Final MIRI delivery to NASA/GSFC in early May 2012.

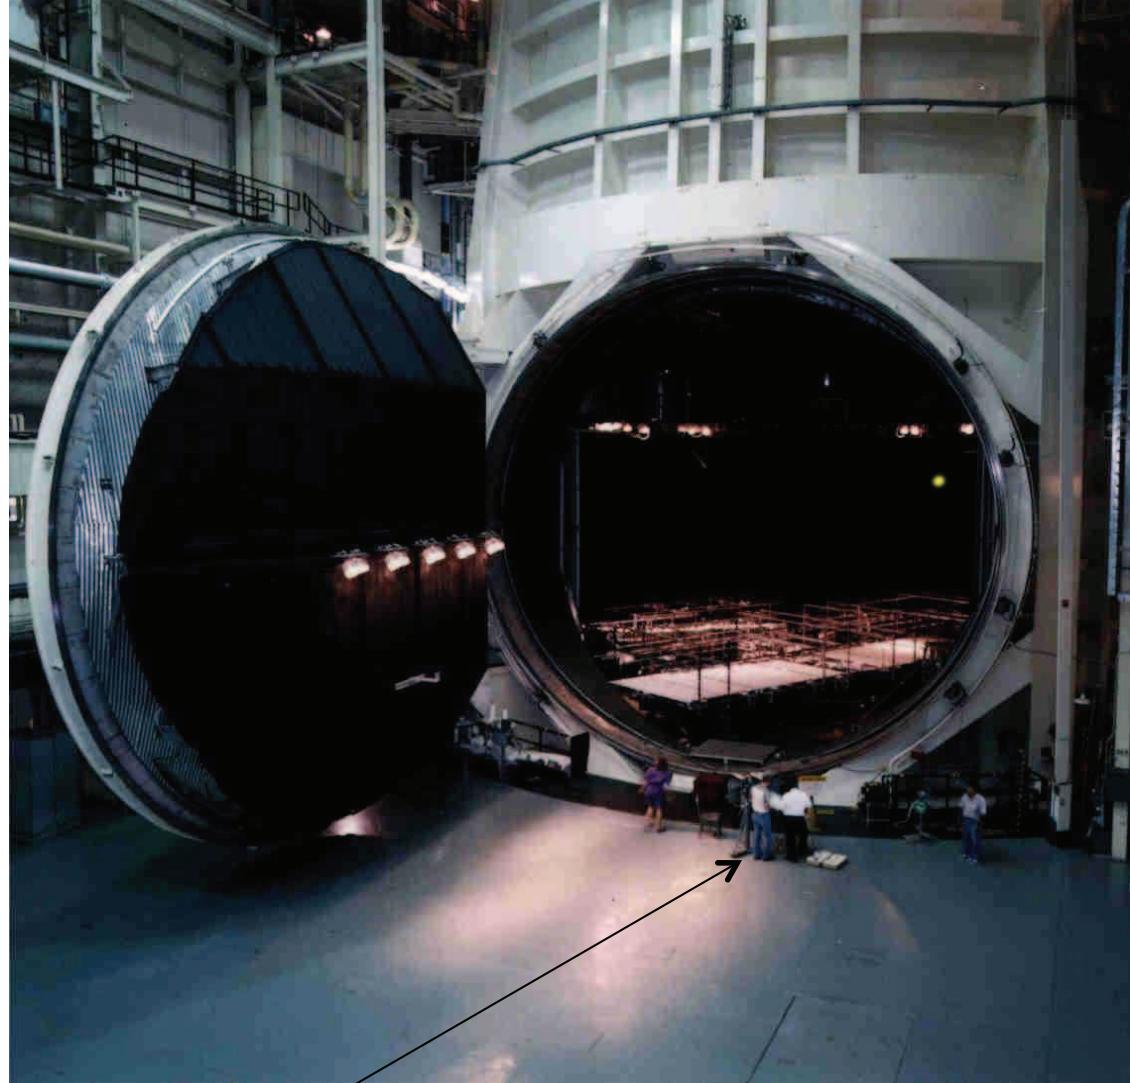

TELESCOPE ARCHITECTURE

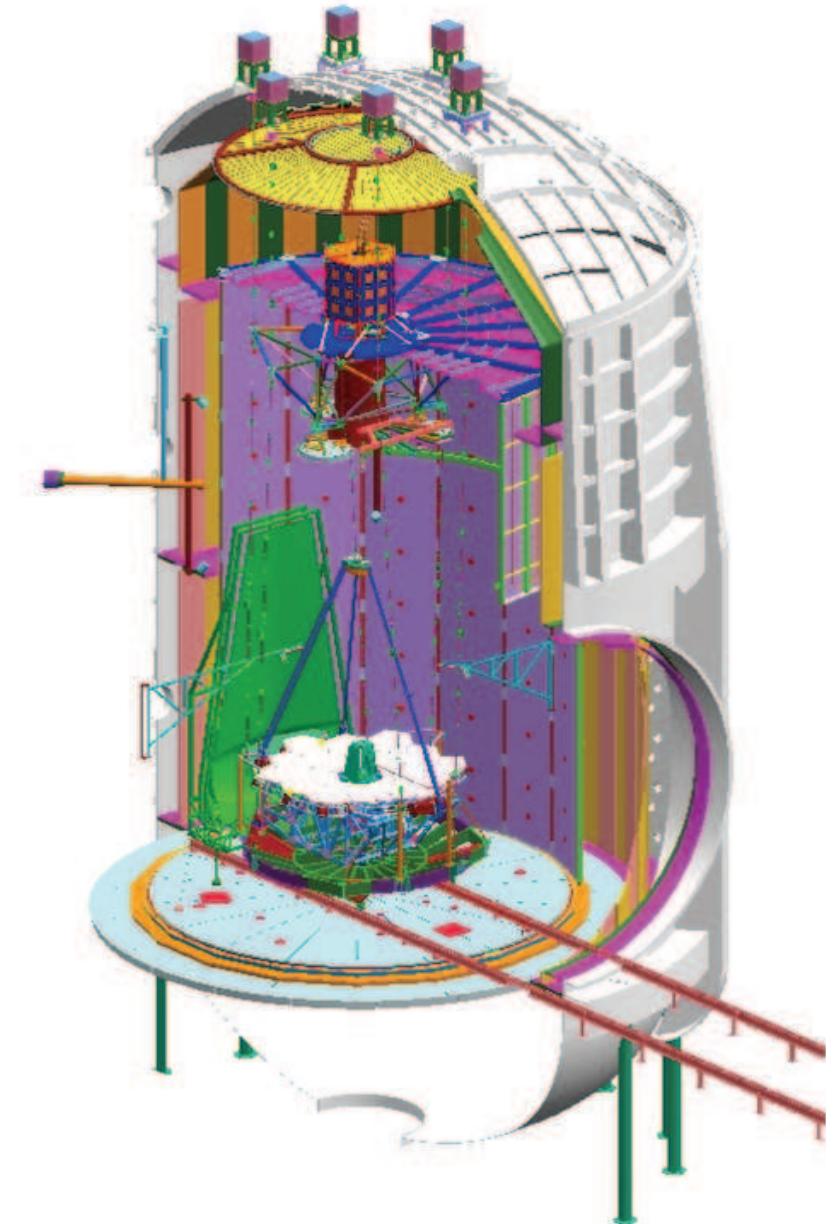

OTE Testing – Chamber A at JSC

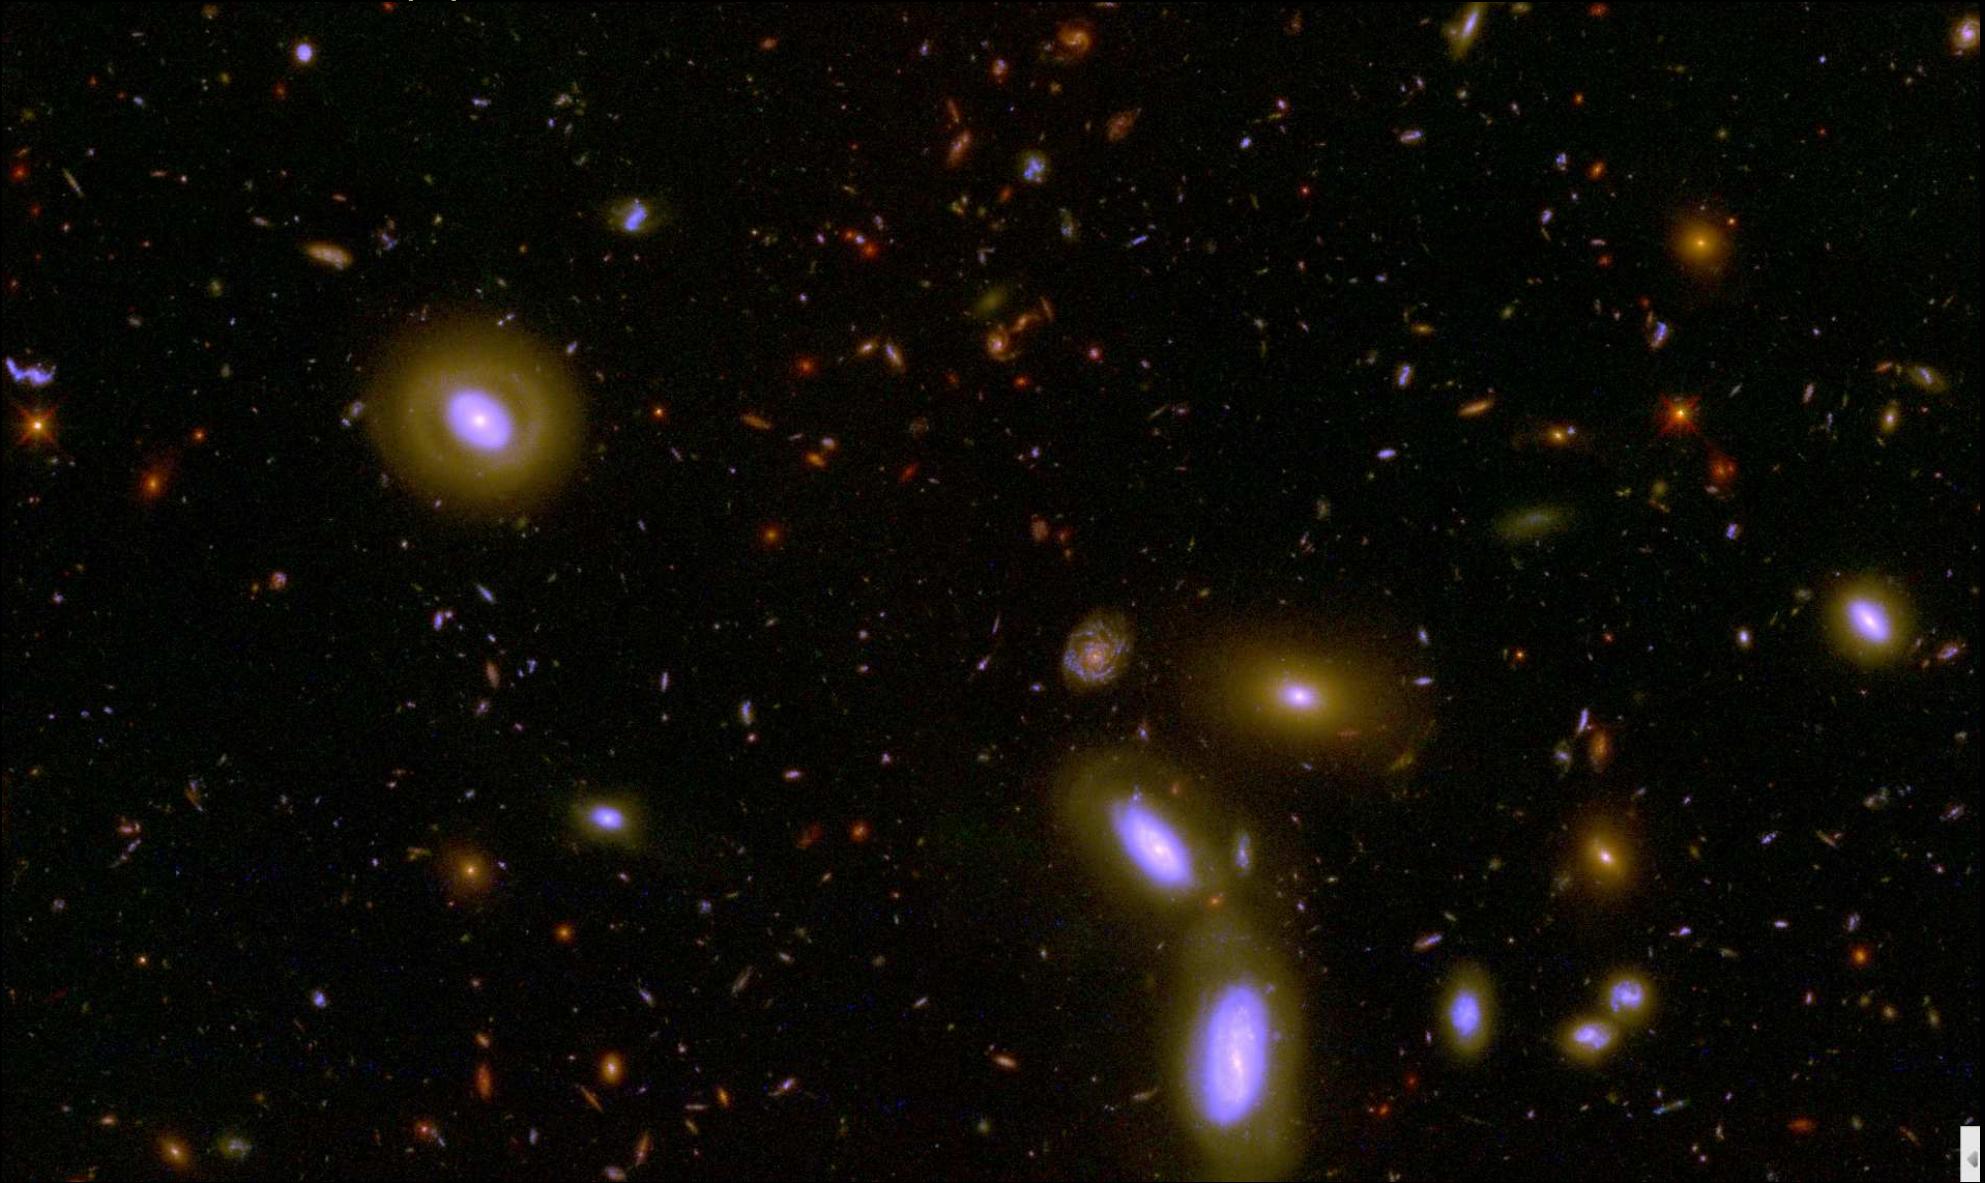

Notice people for scale

Will be the largest cryo vacuum test chamber in the world

- (4) How can JWST measure Galaxy Assembly?

10 filters with HST/WFC3 & ACS reaching AB=26.5–27.0 mag (10- σ) over 40 arcmin² at 0.07–0.15" FWHM from 0.2–1.7 μ m (UVUBVizYJH). JWST adds 0.05–0.2" FWHM imaging to AB \simeq 31.5 mag (1 nJy) at 1–5 μ m, and 0.2–1.2" FWHM at 5–29 μ m, tracing young+old SEDs & dust.

Some science results of the Wide Field Camera Early Release Science data:

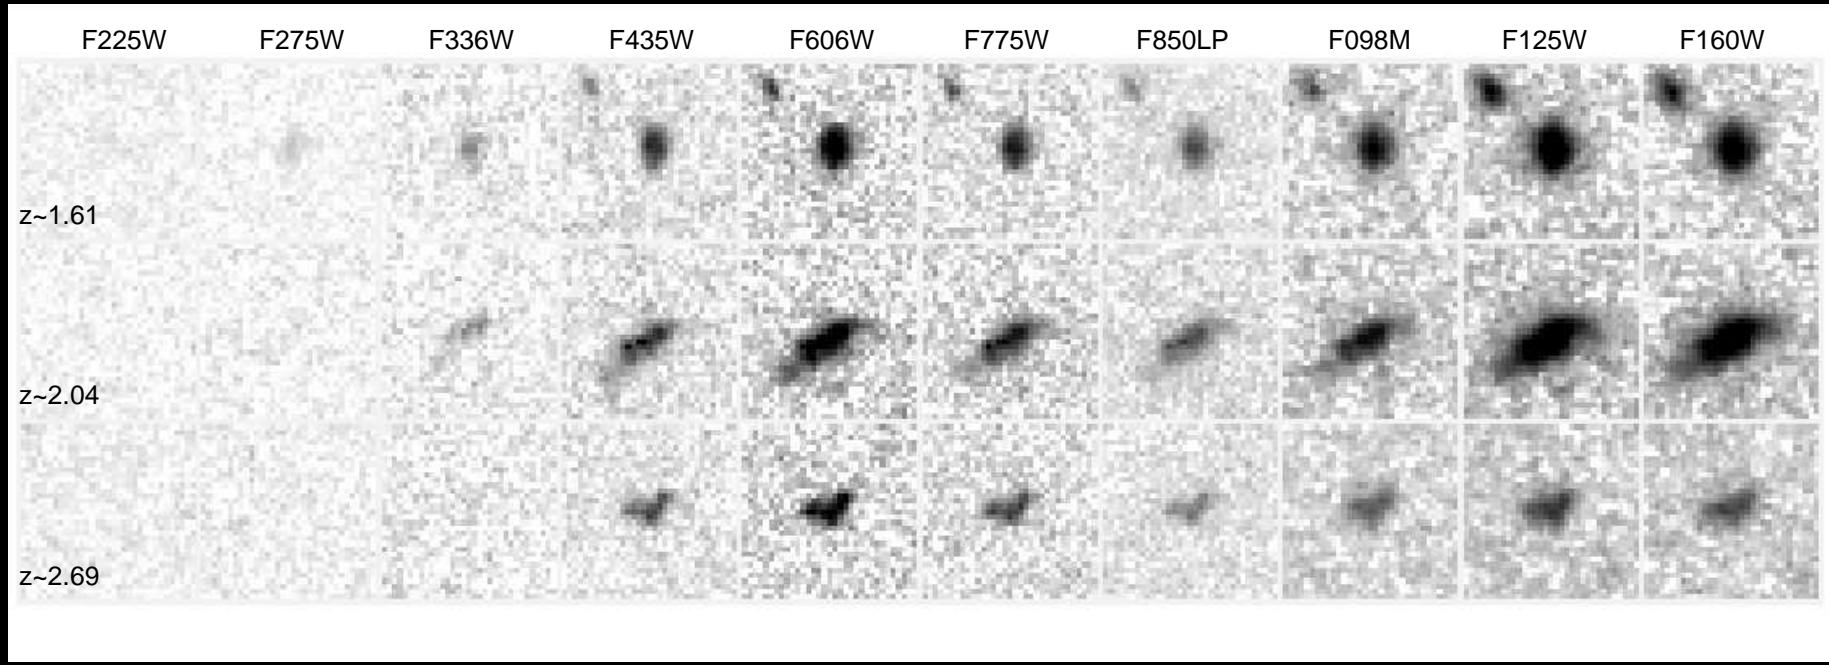

Galaxy structure at the peak of the merging epoch ($z \approx 1-2$) is very rich: some resemble the cosmological parameters H_0 , Ω , ρ_O , w , and Λ , resp.

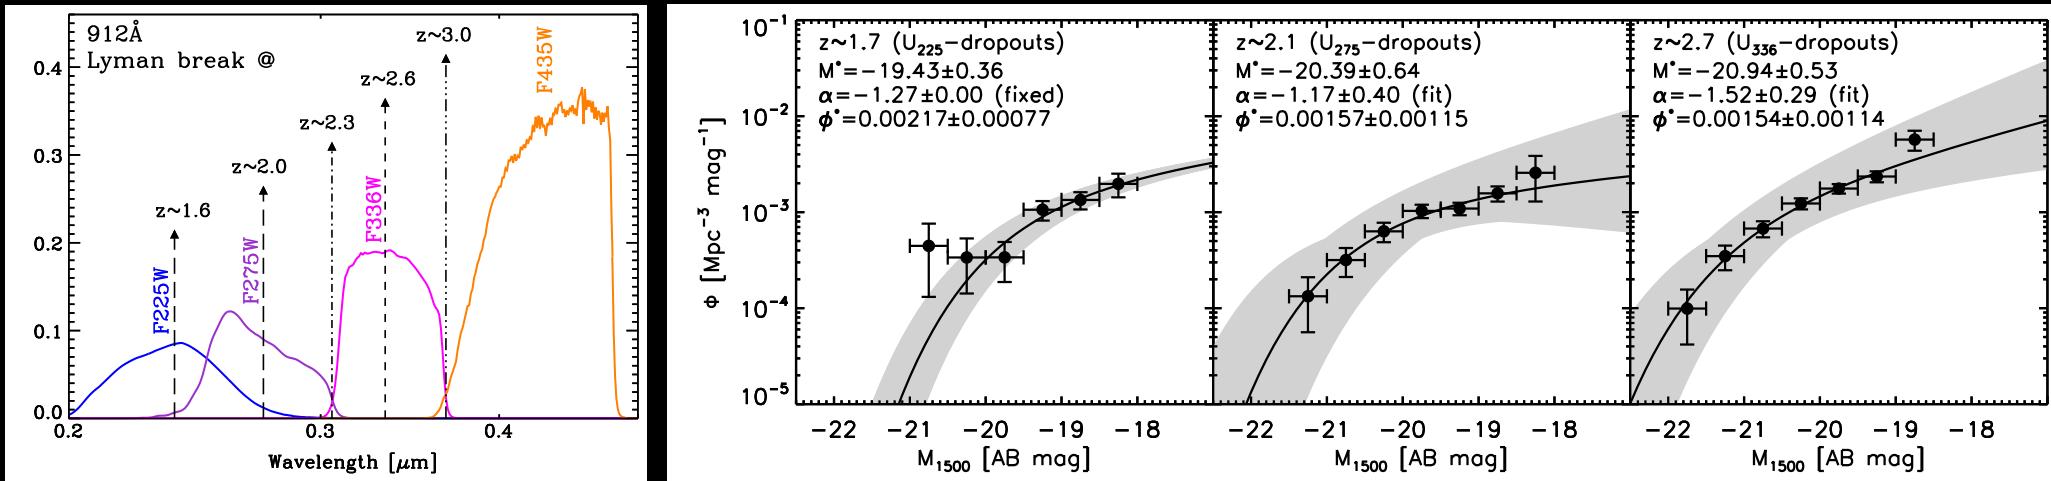

Panchromatic WFC3 ERS images of early-type galaxies with nuclear star-forming rings, bars, weak AGN, or other interesting nuclear structure.

(Rutkowski ea. 2012 ApJS 199, 4) \Longrightarrow “Red & dead” galaxies aren’t dead!

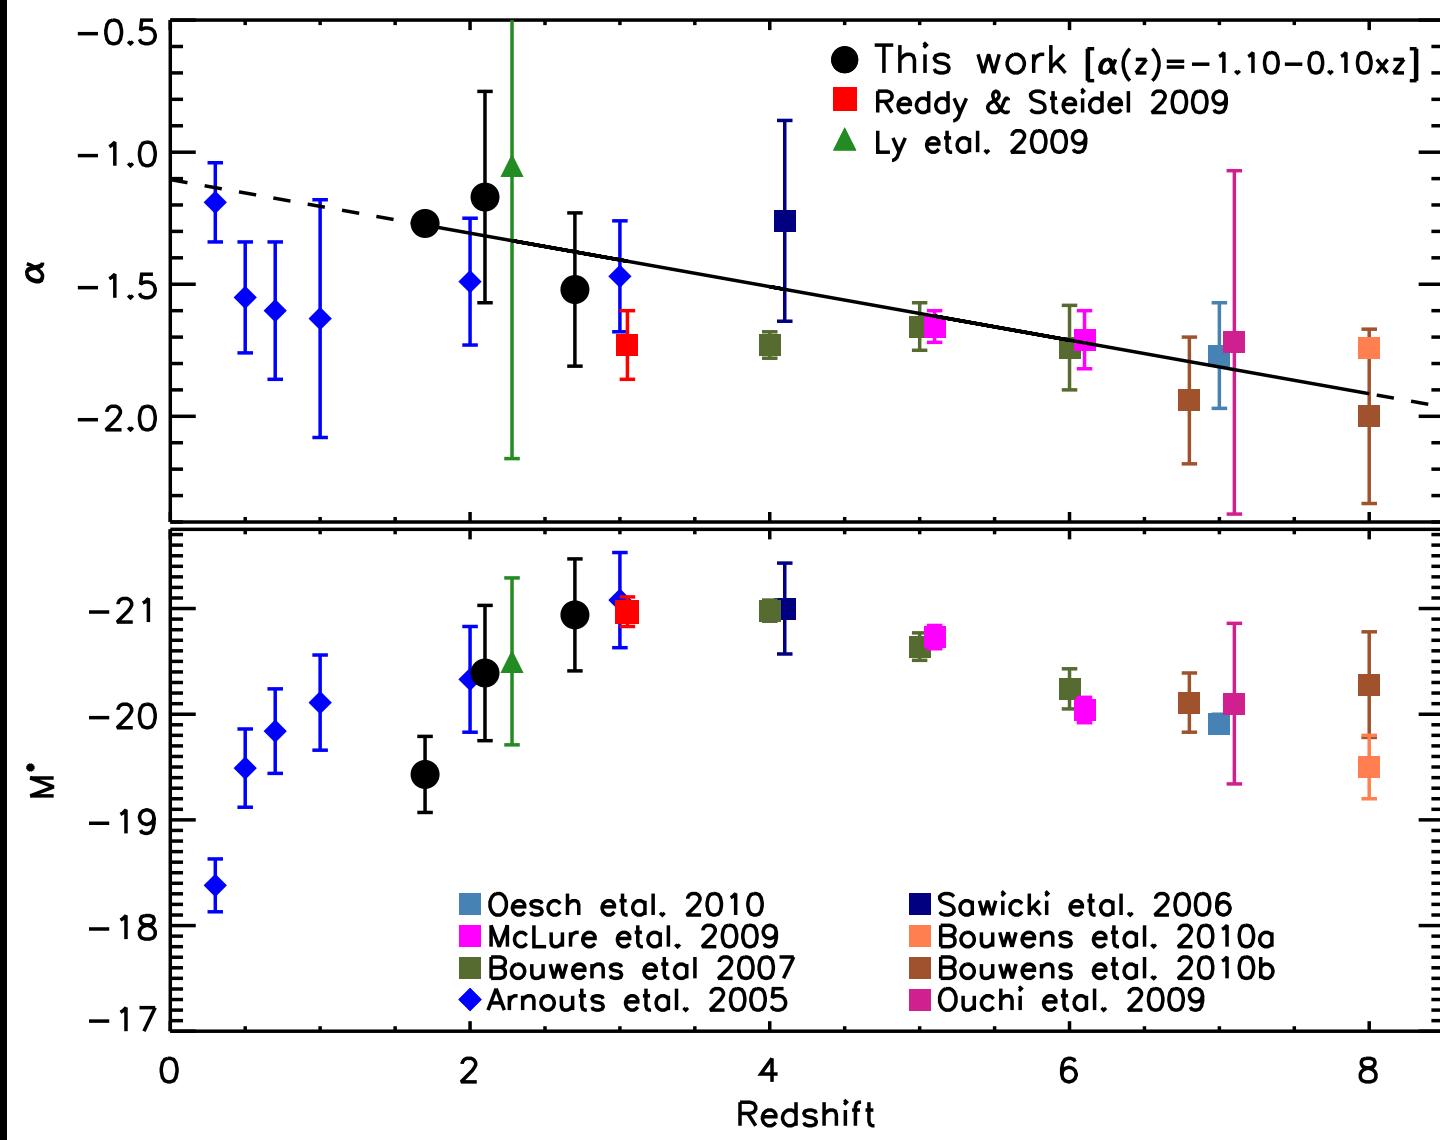

- JWST will observe any such objects from 0.7–29 μm wavelength.

Lyman break galaxies at the peak of cosmic SF ($z \simeq 1\text{-}3$; Hathi et al. 2010)

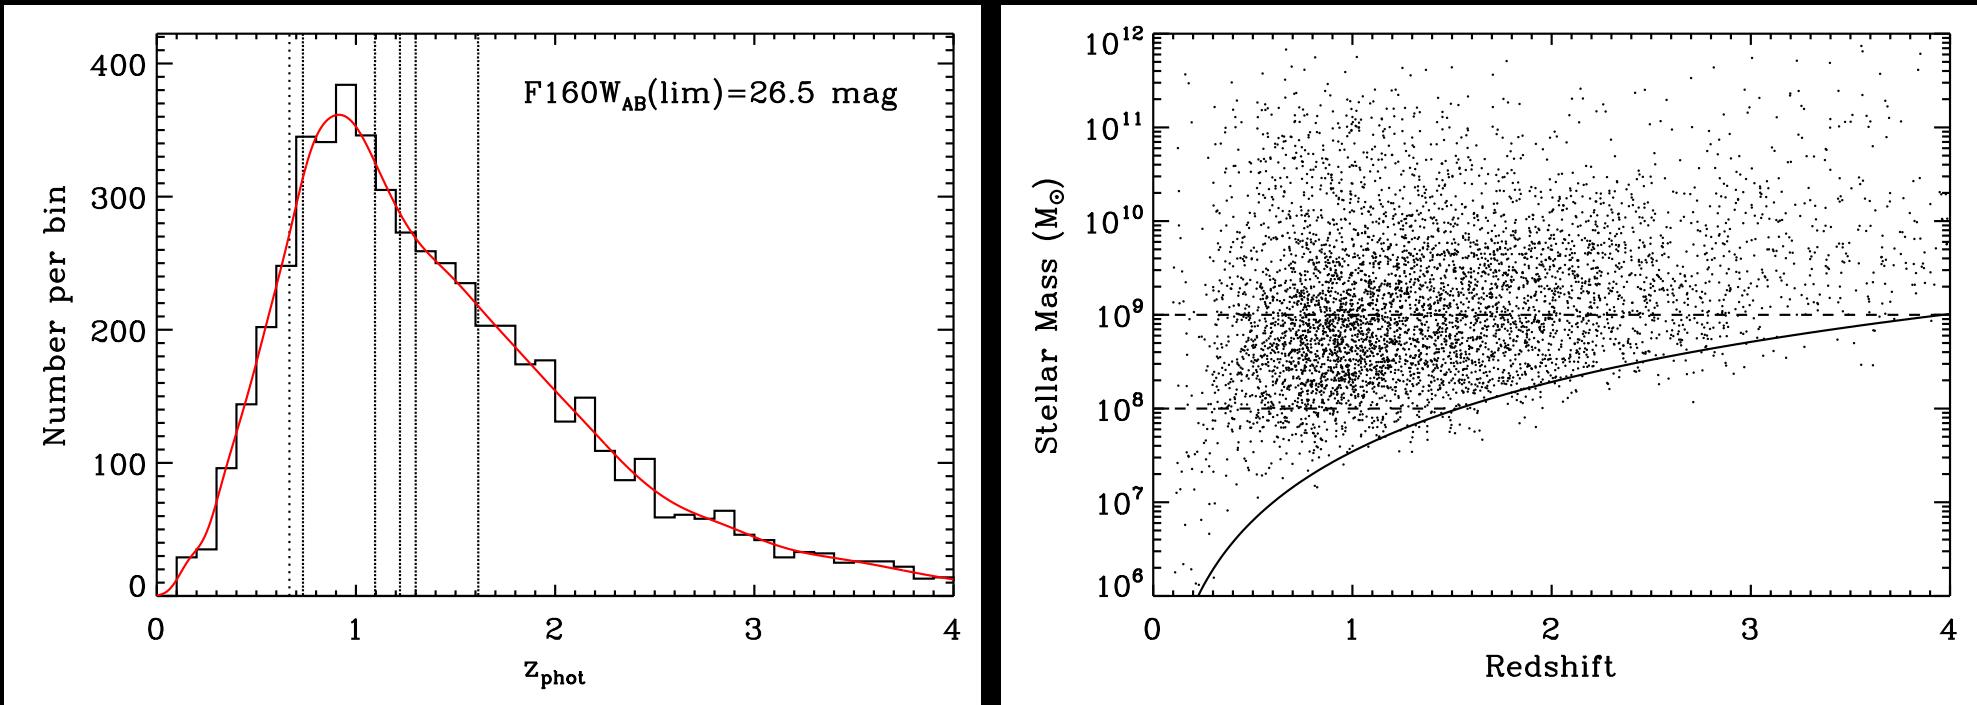

- JWST will similarly measure faint-end LF-slope evolution for $1 \lesssim z \lesssim 12$.
(e.g., Bouwens et al. 2010; Hathi et al. 2012, 2012; Oesch et al. 2010).

Measured faint-end LF slope evolution (top) and characteristic luminosity evolution (bottom) from Hathi et al. 2010 (ApJ, 720, 1708).

- In the JWST regime at $z \gtrsim 8$, expect faint-end LF slope $\alpha \simeq 2.0$.
 - In the JWST regime at $z \gtrsim 8$, expect characteristic luminosity $M^* \gtrsim -19$.
- ⇒ Could have critical consequences for gravitational lensing bias at $z \gtrsim 10$.

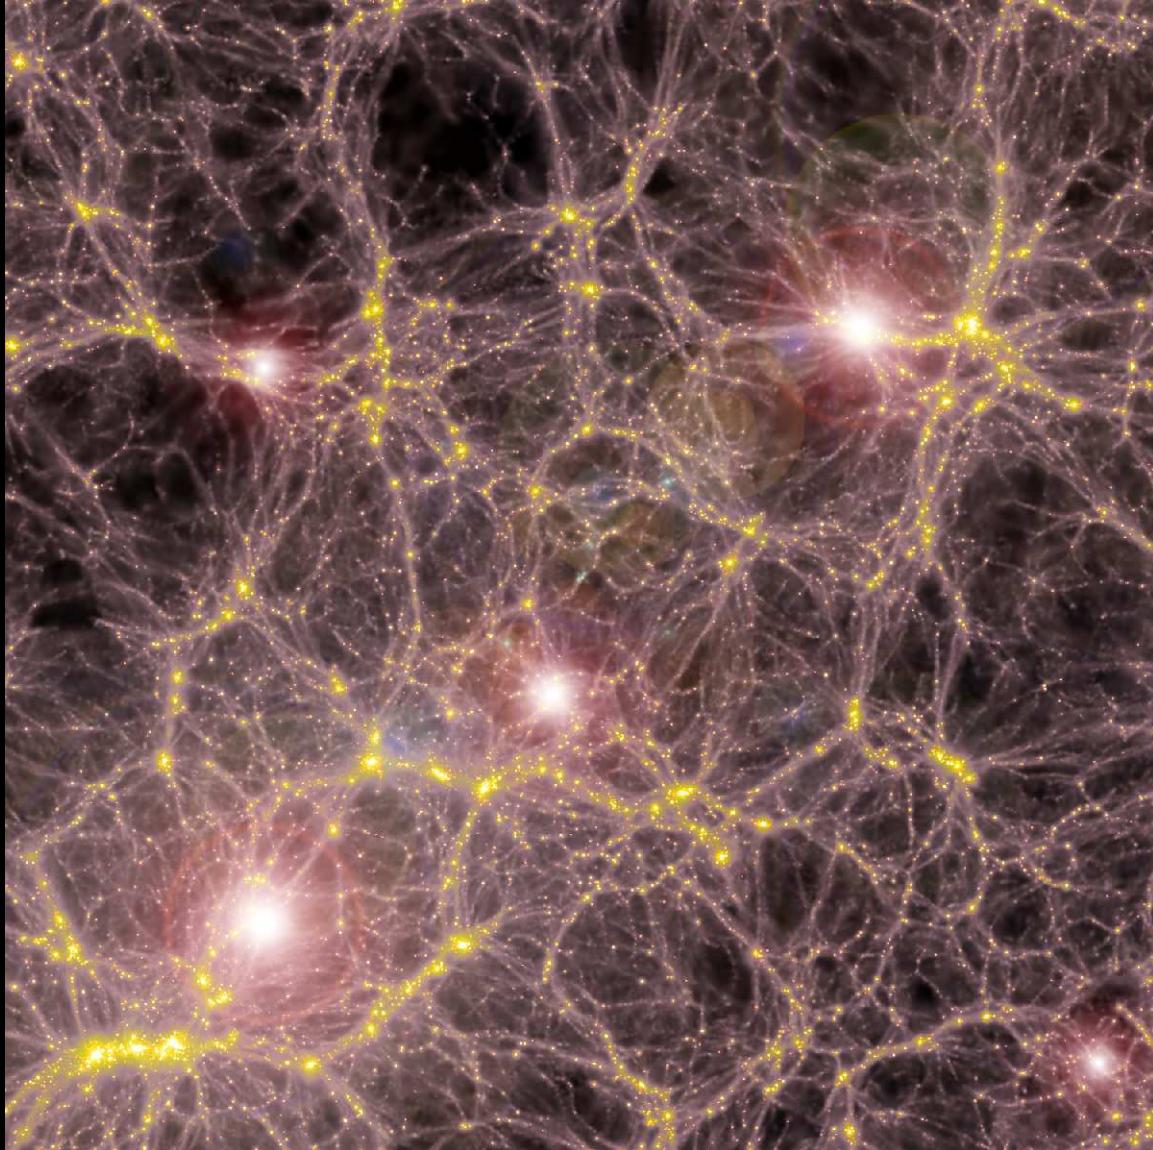

WFC3 ERS 10-band redshift estimates accurate to $\lesssim 4\%$ with small systematic errors (Hathi et al. 2010, 2012), resulting in a reliable $N(z)$.

- Measure masses of faint galaxies to AB=26.5 mag, tracing the process of galaxy assembly: downsizing, merging, (& weak AGN growth?).

ERS shows WFC3's new panchromatic capabilities on galaxies at $z \simeq 0-7$.

- HUDF shows WFC3 $z \simeq 7-9$ capabilities (Bouwens⁺ 2010; Yan⁺ 2010).
- WFC3 is an essential pathfinder at $z \lesssim 8$ for JWST (0.7–29 μm) at $z \gtrsim 9$.
- JWST will trace mass assembly and dust content 3–4 mags deeper from $z \simeq 1-12$, with nanoJy sensitivity from 0.7–5 μm .

(4a) How will JWST Observe First Light and Reionization?

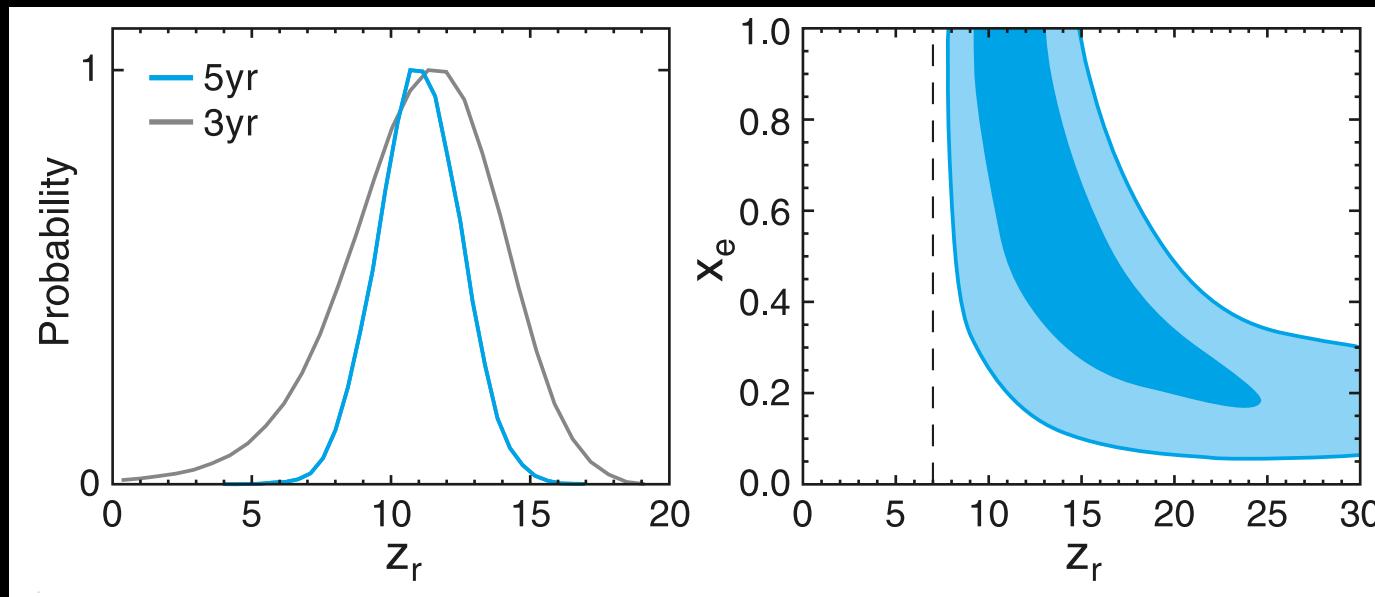

- Detailed Hydrodynamical models (e.g., V. Bromm) suggest that massive Pop III stars may have reionized universe at redshifts $z \lesssim 10-30$ (First Light).
- A this should be visible to JWST as the first Pop III stars and surrounding (Pop II.5) star clusters, and perhaps their extremely luminous supernovae at $z \simeq 10 \rightarrow 30$.

We must make sure we theoretically understand the likely Pop III mass-range, their IMF, their duplicity and clustering properties, their SN-rates, etc.

Implications of the (2011) 7-year WMAP results for JWST science:

HST/WFC3 $z \lesssim 7\text{--}9 \leftarrow$

\longrightarrow JWST $z \simeq 8\text{--}25$

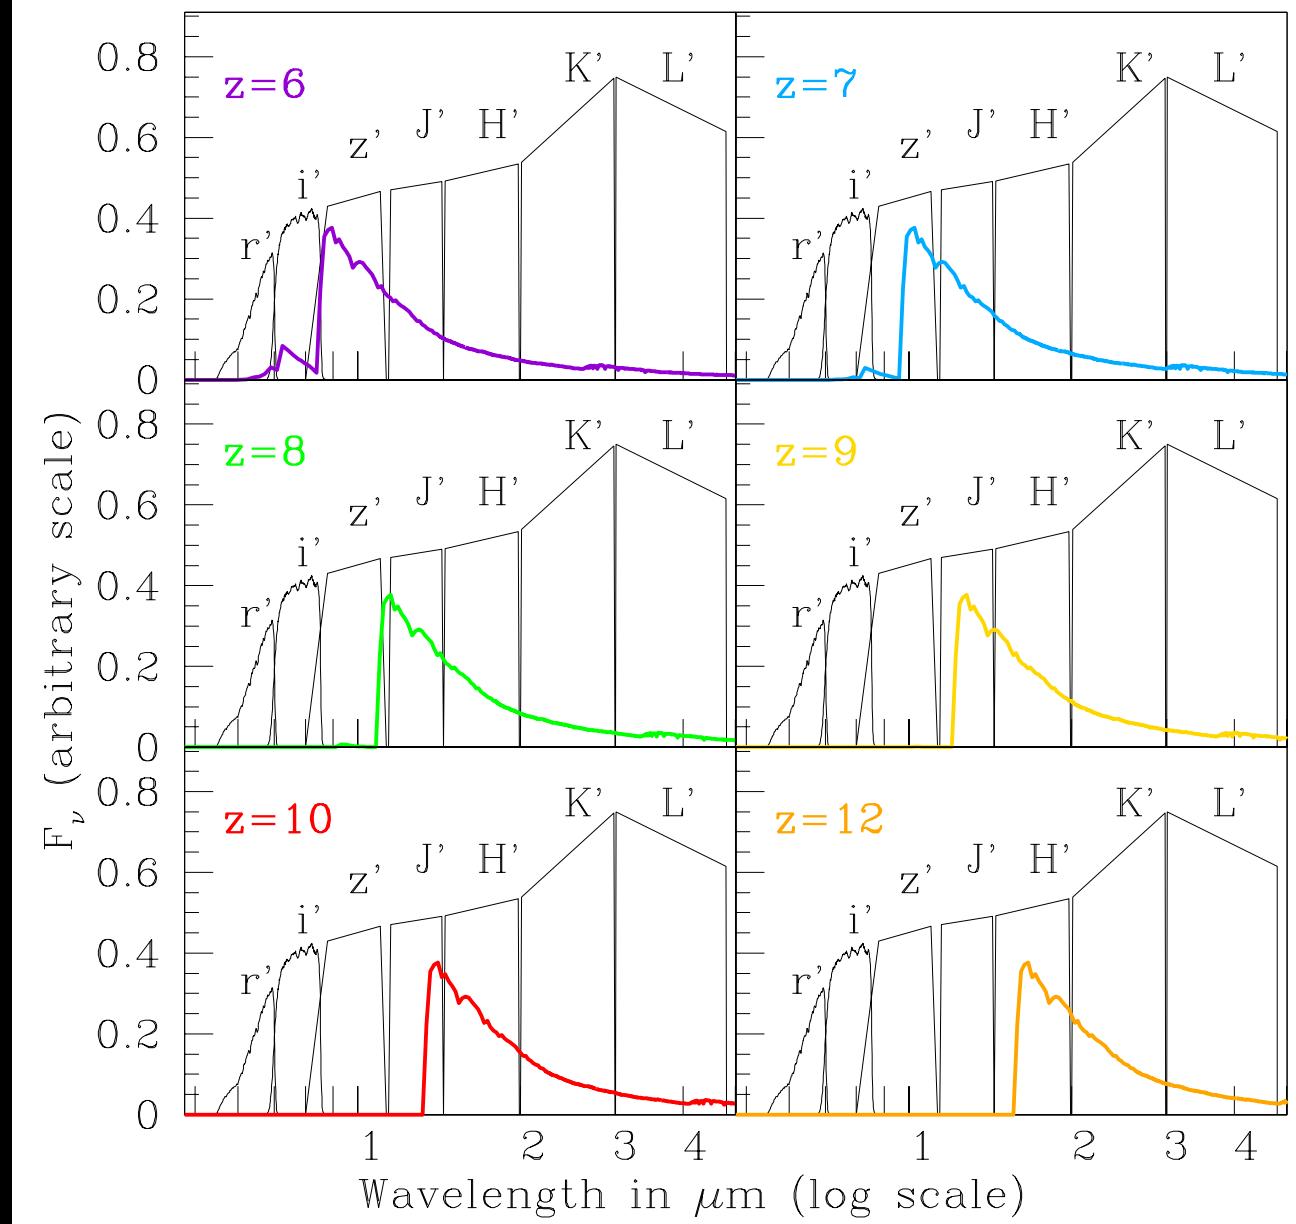

The year-7 WMAP data provided much better foreground removal
(Dunkley et al. 2009; Komatsu et al. 2011; see also Planck 2013):

\implies First Light & Reionization occurred between these extremes:

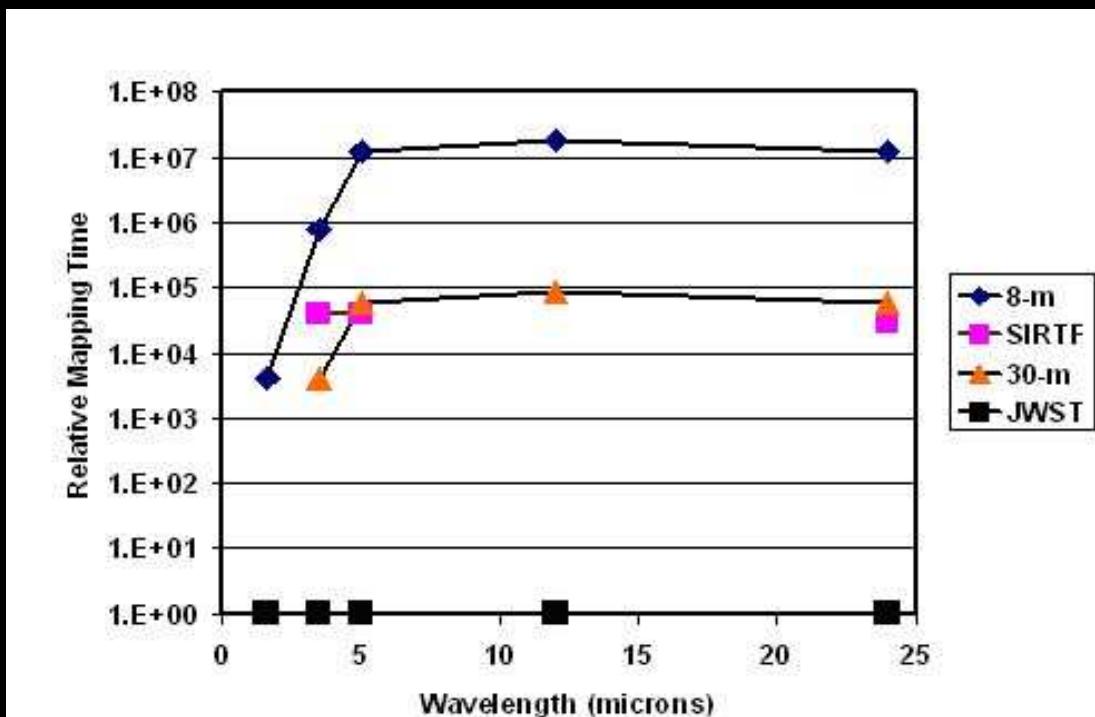

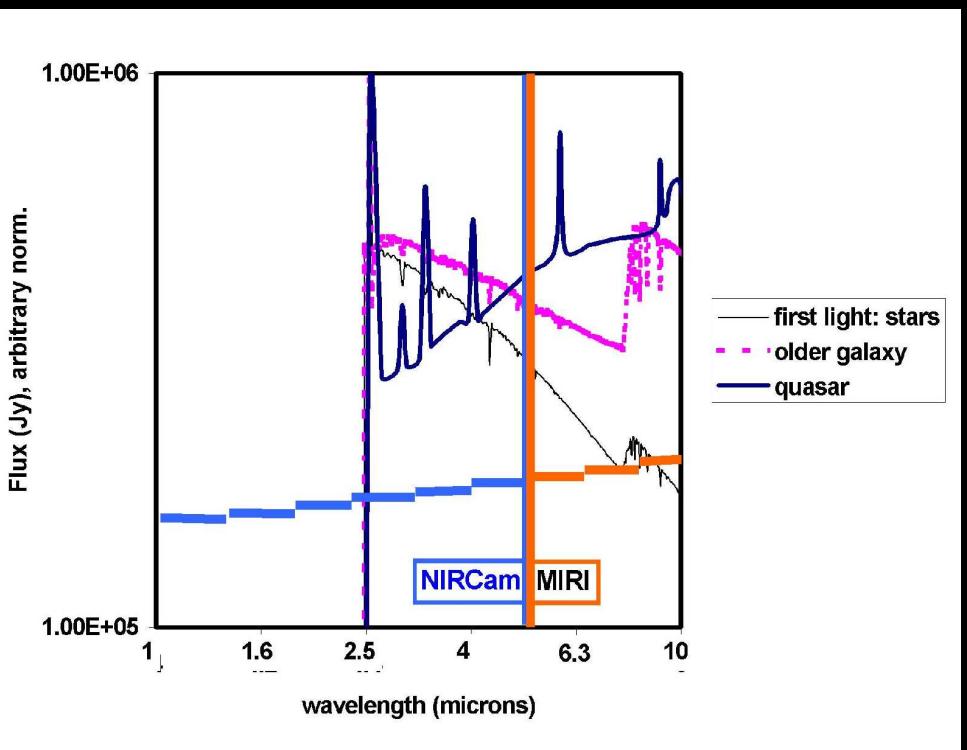

- (1) Instantaneous at $z \simeq 10.4 \pm 1.2$ ($\tau = 0.087 \pm 0.014$), or, more likely:
 - (2) Inhomogeneous & drawn out: starting at $z \gtrsim 20$, peaking at $z \simeq 11$, ending at $z \simeq 7$. The implications for HST and JWST are:
 - HST/ACS has covered $z \lesssim 6$, and WFC3 is now covering $z \lesssim 7\text{--}9$.
 - For First Light & Reionization, JWST must sample $z \simeq 8$ to $z \simeq 15\text{--}20$.
- \Rightarrow JWST must cover $\lambda = 0.7\text{--}29 \mu\text{m}$, with its diffraction limit at $2.0 \mu\text{m}$.

(4) How will JWST measure First Light & Reionization?

- Can't beat redshift: to see First Light, must observe near-mid IR.
⇒ This is why JWST needs NIRCam at 0.8–5 μm and MIRI at 5–28 μm .

- (4) What sensitivity will JWST have?

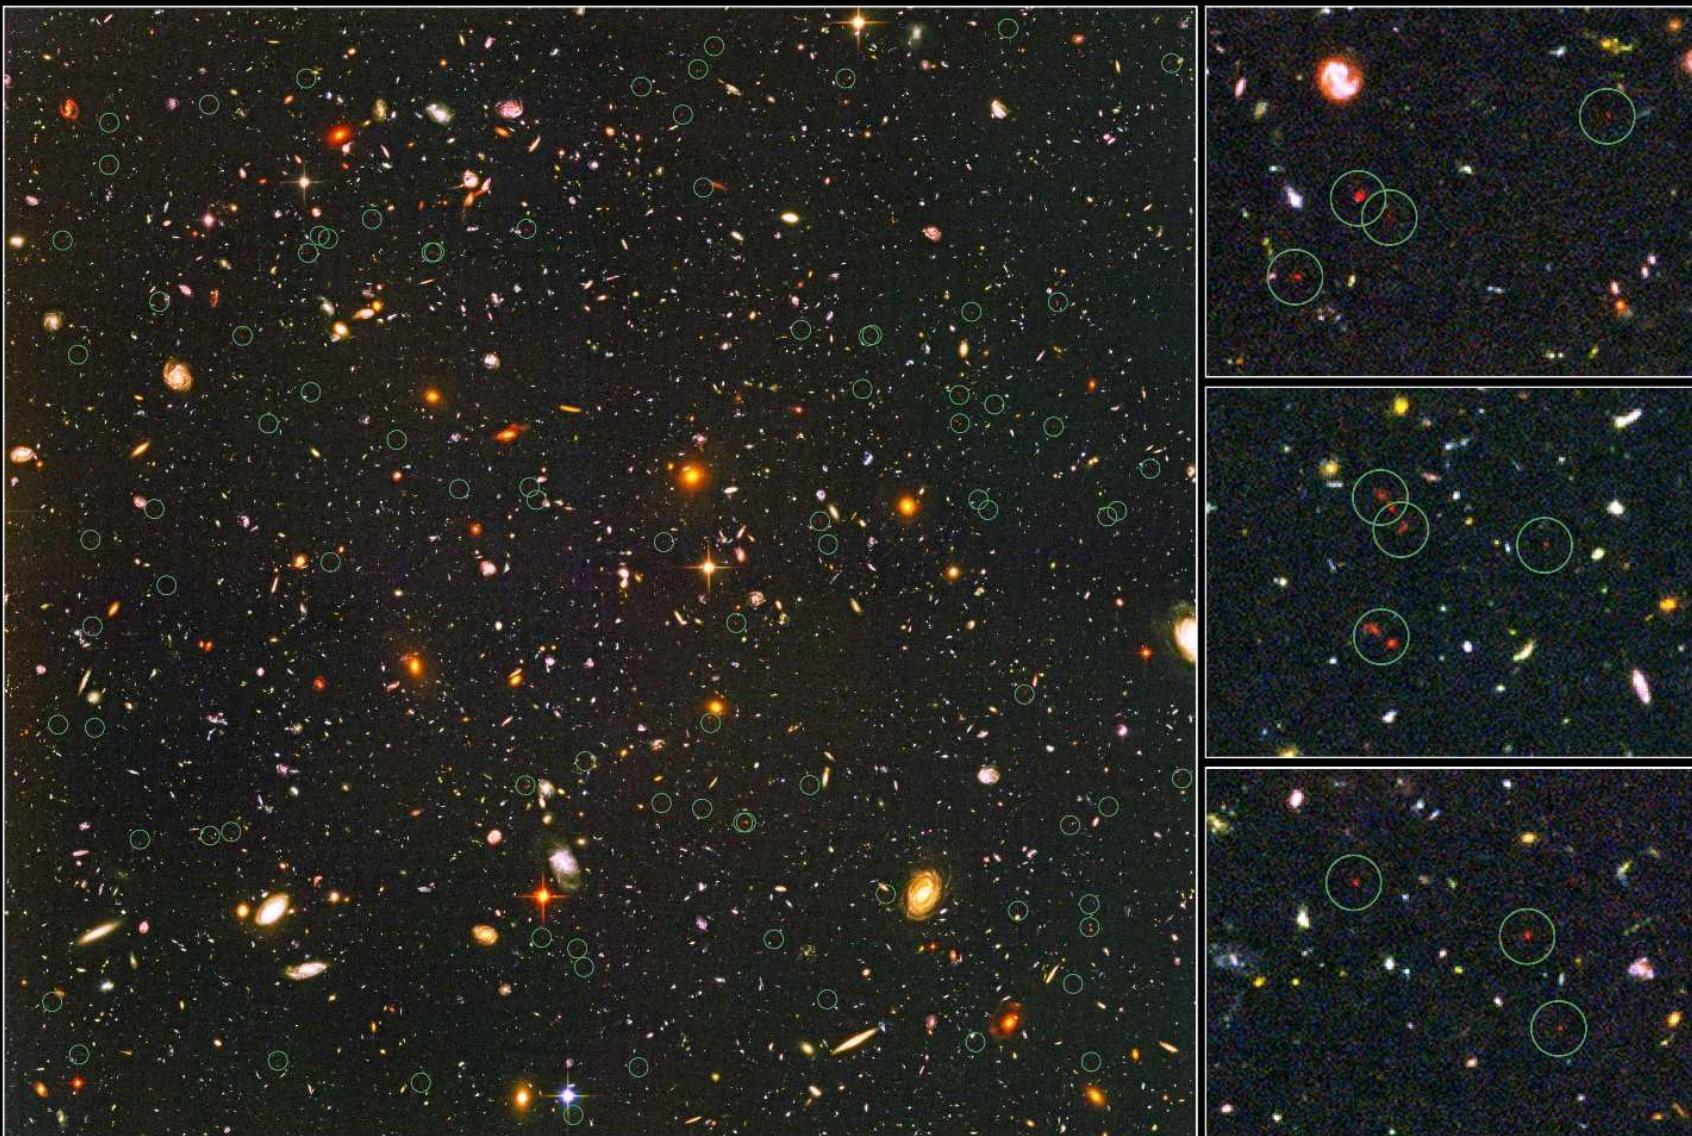

NIRCam and MIRI sensitivity complement each other, straddling $\lambda \simeq 5 \mu\text{m}$.

Together, they allow objects to be found to $z=15-20$ in $\sim 10^5$ sec (28 hrs).

LEFT: NIRCam and MIRI broadband sensitivity to a Quasar, a “First Light” galaxy dominated by massive stars, and a 50 Myr “old” galaxy at $z=20$.

RIGHT: Relative survey time vs. λ that Spitzer, a ground-based IR-optimized 8-m, and a 30-m telescope would need to match JWST.

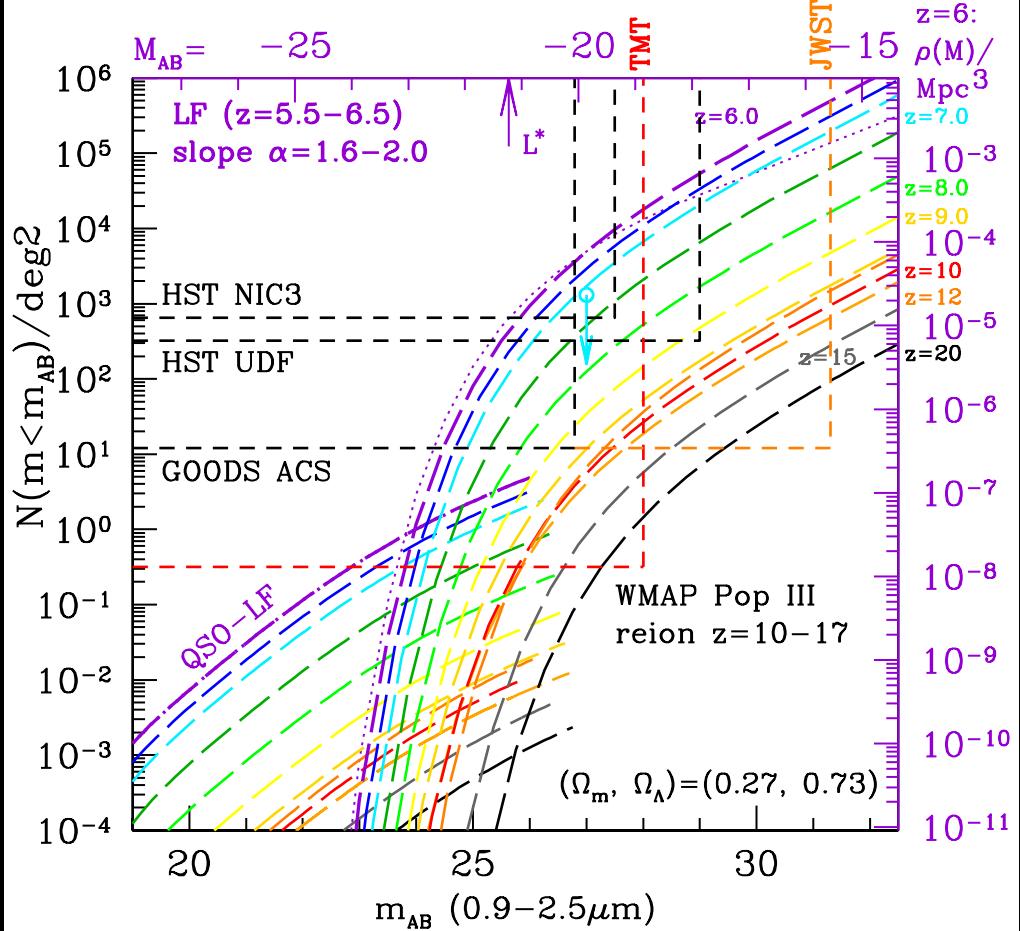

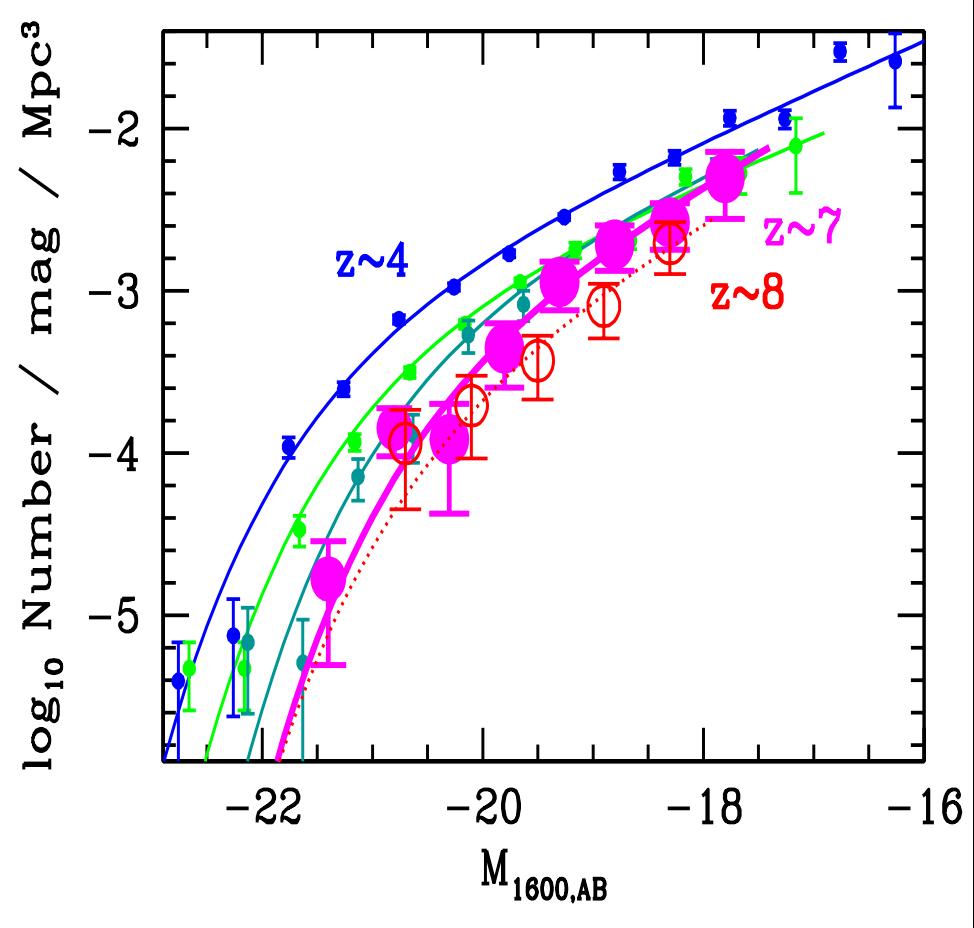

Distant Galaxies in the Hubble Ultra Deep Field
Hubble Space Telescope • Advanced Camera for Surveys

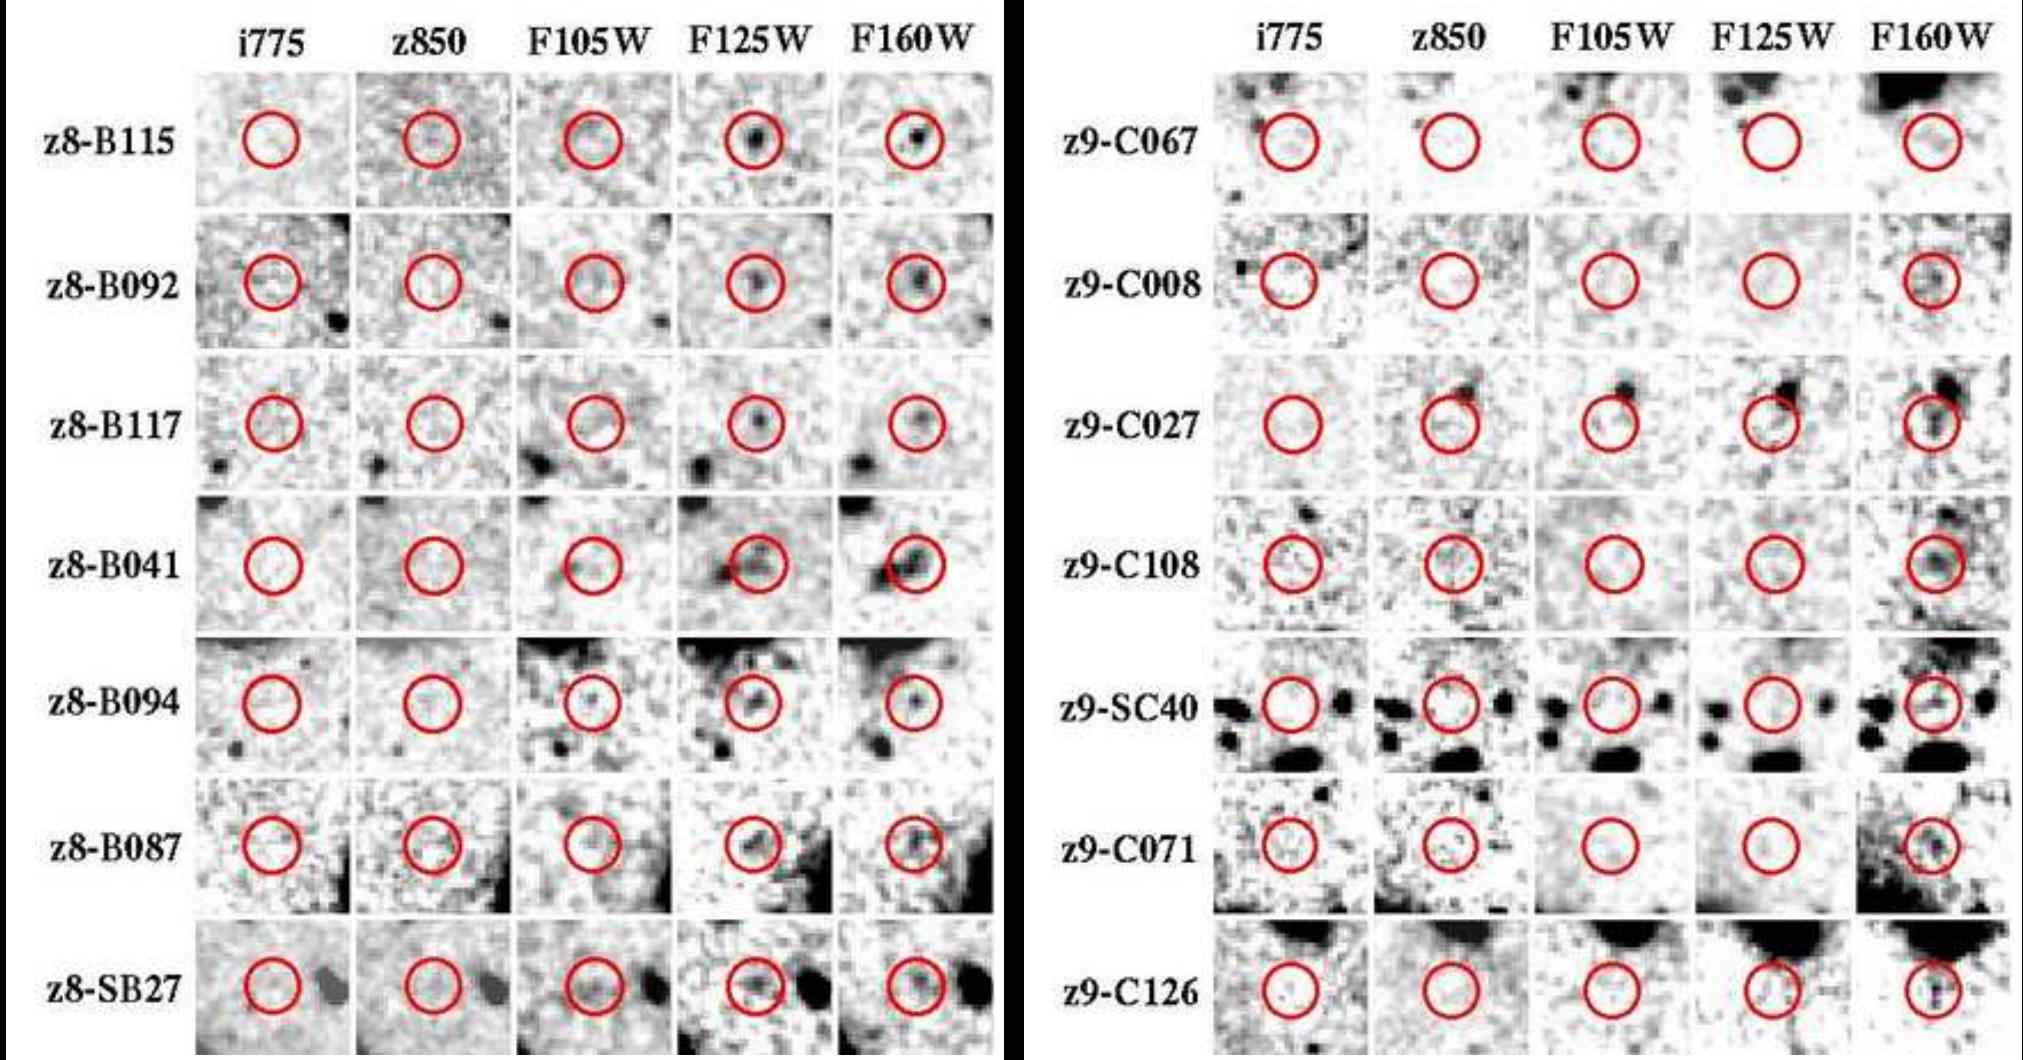

NASA, ESA, R. Windhorst (Arizona State University) and H. Yan (Spitzer Science Center, Caltech)

STScI-PRC04-28

Hubble UltraDeep Field: Dwarf galaxies at $z \simeq 6$ (age $\simeq 1$ Gyr; Yan & Windhorst 2004), many confirmed by spectra at $z \simeq 6$ (Malhotra et al. 2005).

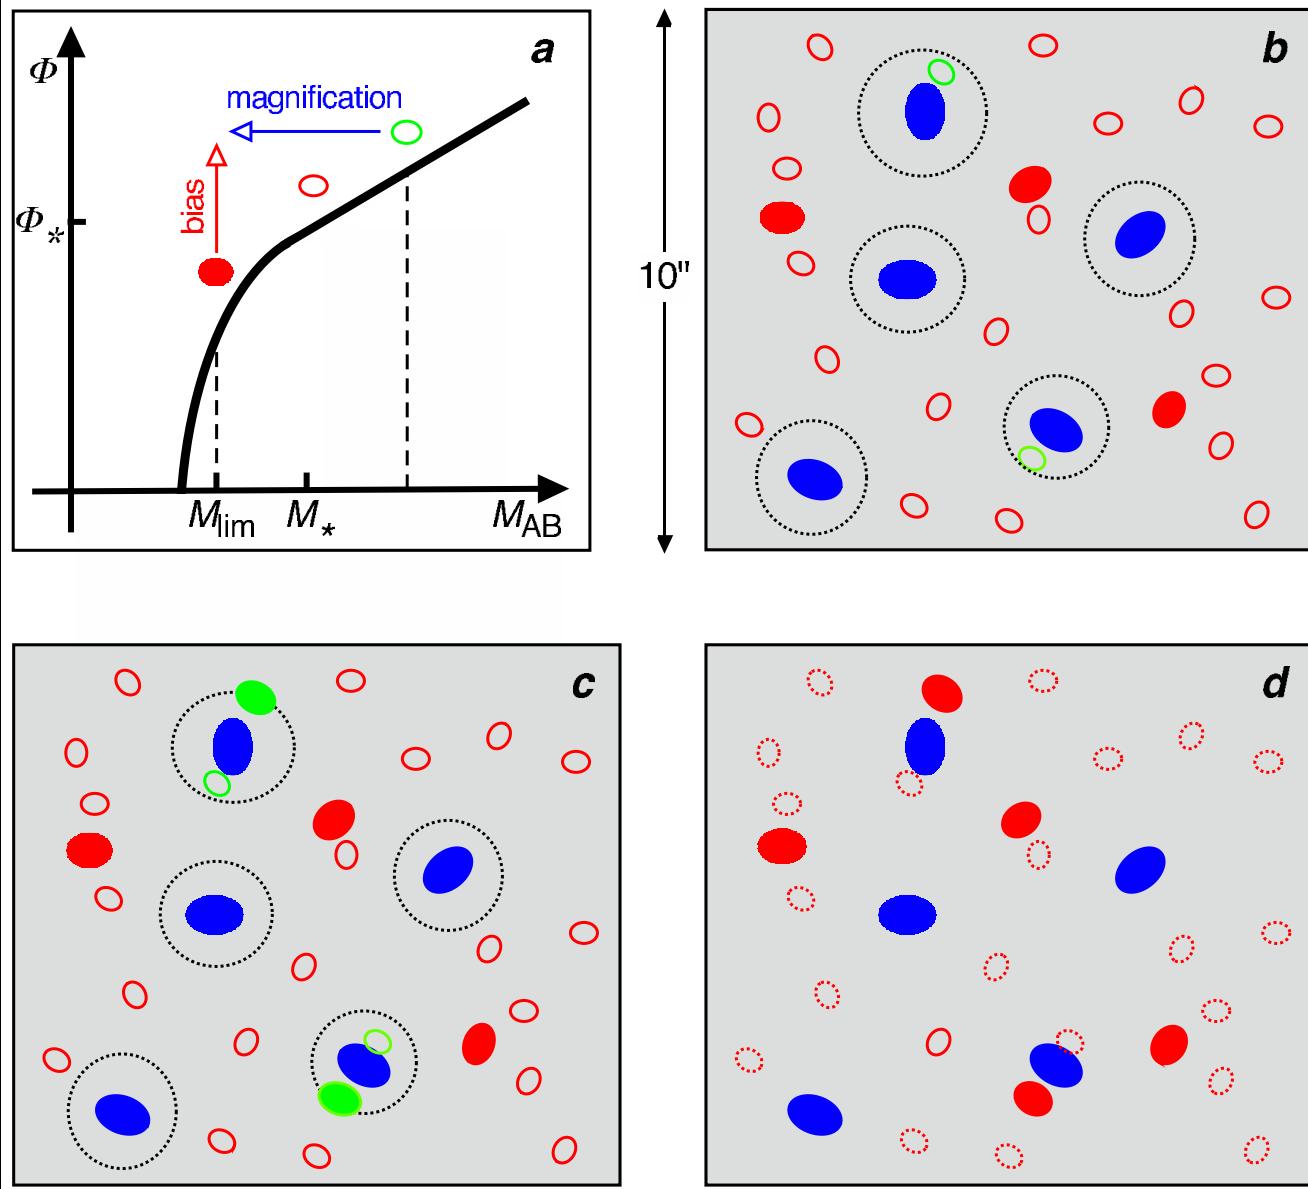

- Objects at $z \gtrsim 9$ are rare (Bouwens⁺ 10; Trenti,⁺ 10; Yan⁺ 10), since volume elt is small, and JWST samples brighter part of LF. JWST needs its sensitivity/aperture (A), field-of-view (Ω), and λ -range (0.7-29 μm).
- With proper survey strategy (area AND depth), JWST can trace the entire reionization epoch and detect the first star-forming objects.
- JWST Coronagraphs can also trace super-massive black-holes as faint quasars in young galaxies: JWST needs 2.0 μm diffraction limit for this.

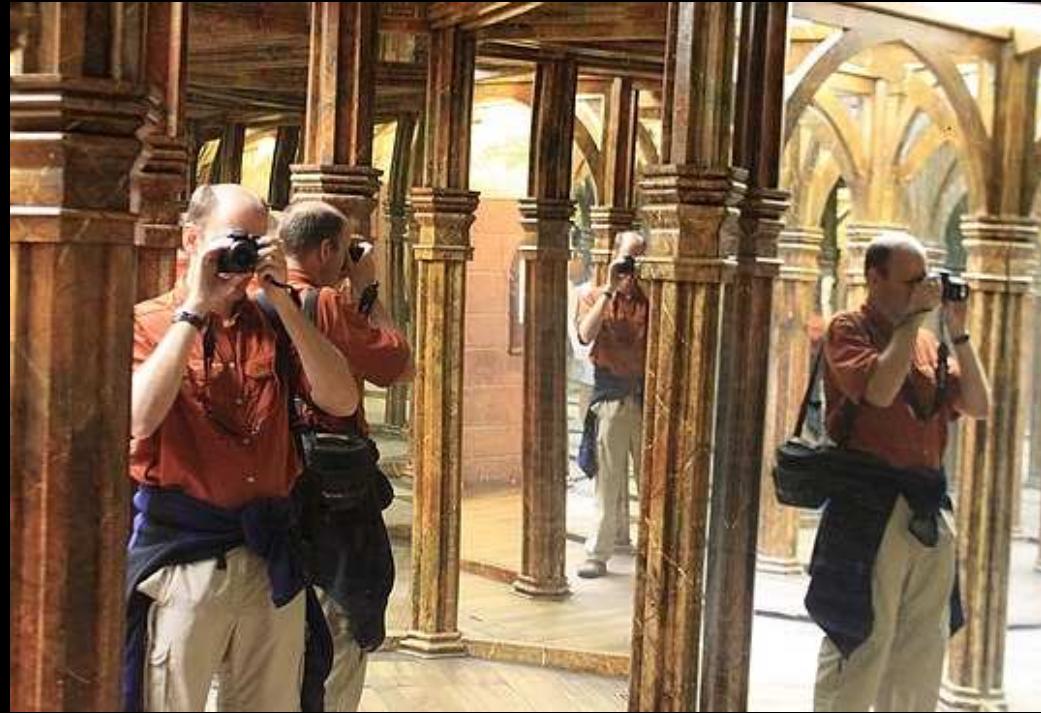

- \sim 10–40% of the HUDF Y-drops and J-drops appear close to bright galaxies (Yan et al. 2010, Res. Astr. & Ap., 10, 867).
- This is expected from gravitational lensing bias by galaxy dark matter halo distribution at $z \simeq 1$ –2 (Wyithe et al. 2011, Nature, 469, 181).
- Need JWST to measure $z \simeq 9$ –15 LFs, and see if fundamentally different from $z \lesssim 8$. Does gravitational lensing bias boost LF bright-end?

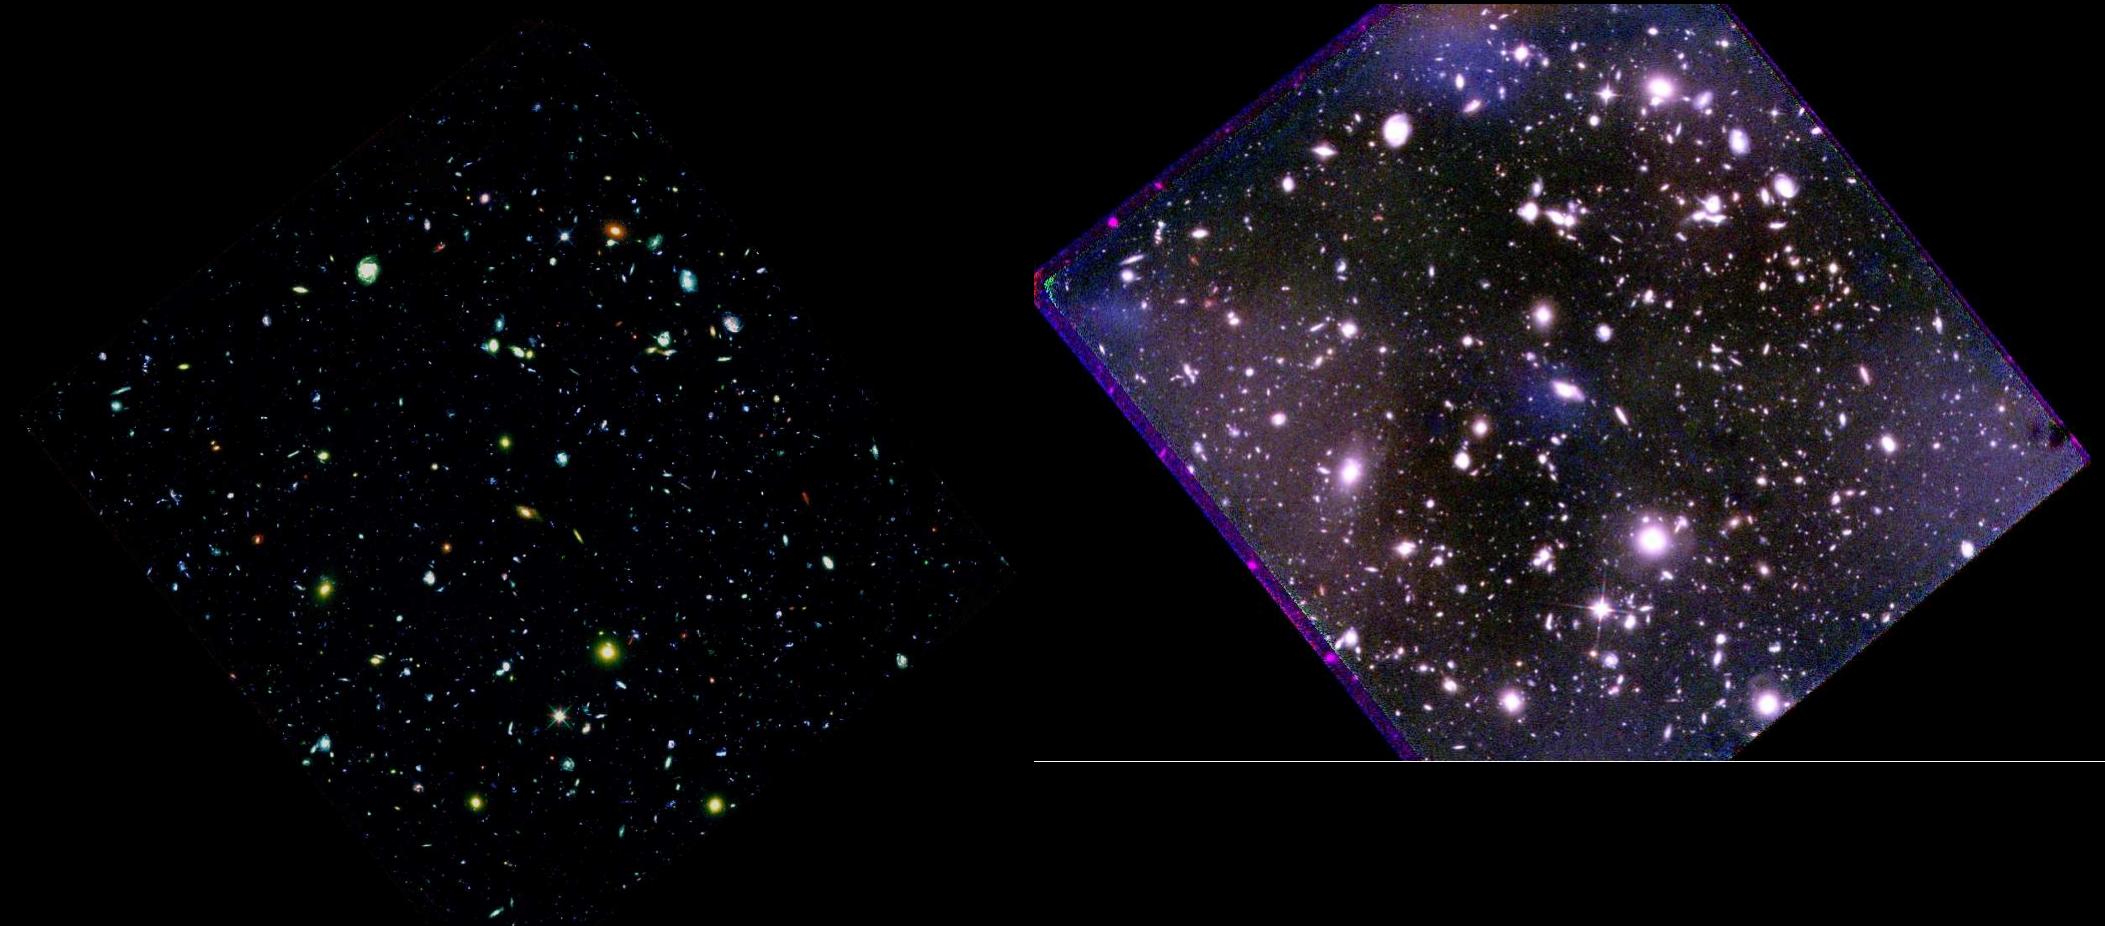

Hard to see the forest for the trees in the first 0.5 Gyrs?:

- Foreground galaxies ($z \simeq 1-2$ or age $\simeq 3-6$ Gyr) may gravitationally lens or amplify galaxies at $z \gtrsim 8-10$ (cosmic age $\lesssim 0.5$ Gyr; Wyithe et al. 2011).
- This could change the landscape for JWST observing strategies.

Two fundamental limitations determine ultimate JWST image depth:

- (1) Cannot-see-the-forest-for-the-trees effect: Background objects blend into foreground neighbors \Rightarrow Need multi- λ deblending algorithms!
 - (2) House-of-mirrors effect: (Many?) First Light objects can be gravitationally lensed by foreground galaxies \Rightarrow Must model/correct for this!
- Proper JWST 2.0 μm PSF and straylight specs essential to handle this.

(Left) 128-hr HST/WFC3 IR-mosaic in HUDF at $1\text{--}1.6\mu\text{m}$ (YJH filters; Bouwens et al 2010, Yan et al. 2010; +85-hr by R. Ellis in 09/2012).

(Right) Same WFC3 IR-mosaic, but stretched to $\lesssim 10^{-3}$ of Zodical sky!

- The CLOSED-TUBE HST has residual low-level systematics: Imperfect removal of detector artifacts, flat-fielding errors, and/or faint straylight.

⇒ The open JWST architecture needs very good baffling and rogue path mitigation to do ultradeep JWST fields (JUDF's) to 10^{-4} of sky.

(5) Conclusions

(1) HST set stage to measure galaxy assembly in the last 12.7-13.0 Gyrs.

- Today's Hubble sequence formed 7–10 Gyrs ago.

(2) JWST passed Preliminary & Critical Design Reviews in 2008 & 2010.

Management replan in 2010-2011. No technical showstoppers thus far:

- More than 75% of JWST H/W built or in fab, & meets/exceeds specs.

(3) JWST is designed to map the epochs of First Light, Reionization, and Galaxy Assembly & SMBH-growth in detail. JWST will determine:

- Formation and evolution of the first star-clusters after 0.2 Gyr.
- How dwarf galaxies formed and reionized the Universe after 1 Gyr.
- How to find water and CO₂ in transiting Earth-like exoplanets.

(4) JWST will have a major impact on astrophysics this decade:

- IR sequel to HST after 2018: Training the next generation researchers.

(4b) Predicted Galaxy Appearance for JWST at redshifts $z \simeq 1-15$

NGC 3310

ESO0418-008

UGC06471-2

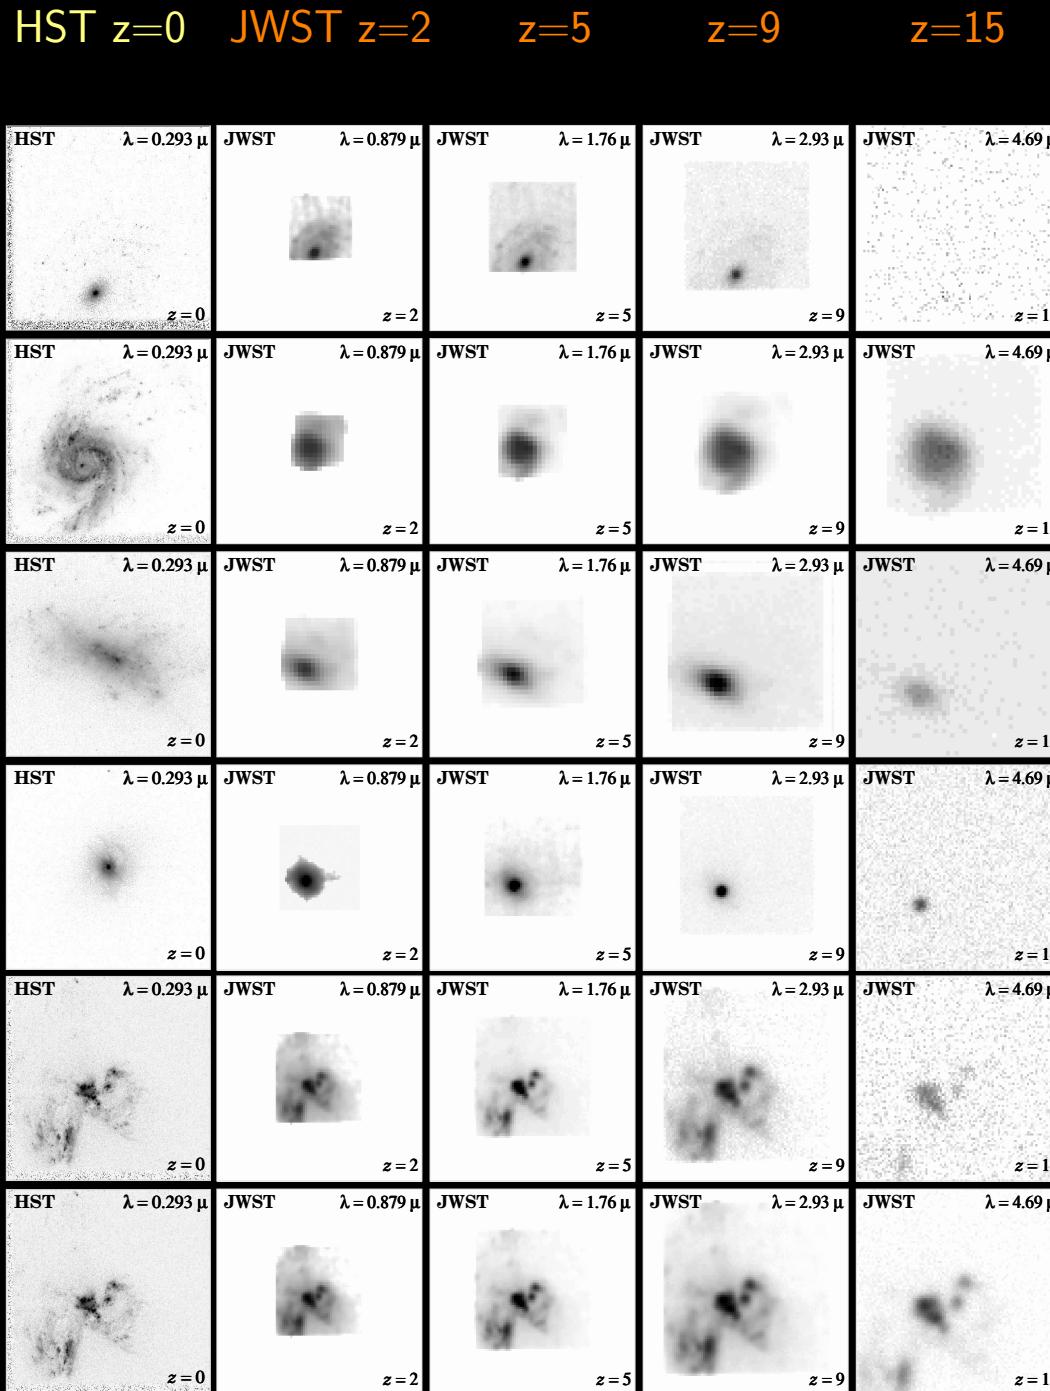

Ultraviolet Galaxies

NASA and R. Windhorst (Arizona State University) • STScI-PRC01-04

HST • WFPC2

- The rest-frame UV-morphology of galaxies is dominated by young and hot stars, with often significant dust imprinted (Mager-Taylor et al. 2005).
- High-resolution HST ultraviolet images are benchmarks for comparison with very high redshift galaxies seen by JWST.

(4b) Predicted Galaxy Appearance for JWST at redshifts $z \simeq 1-15$

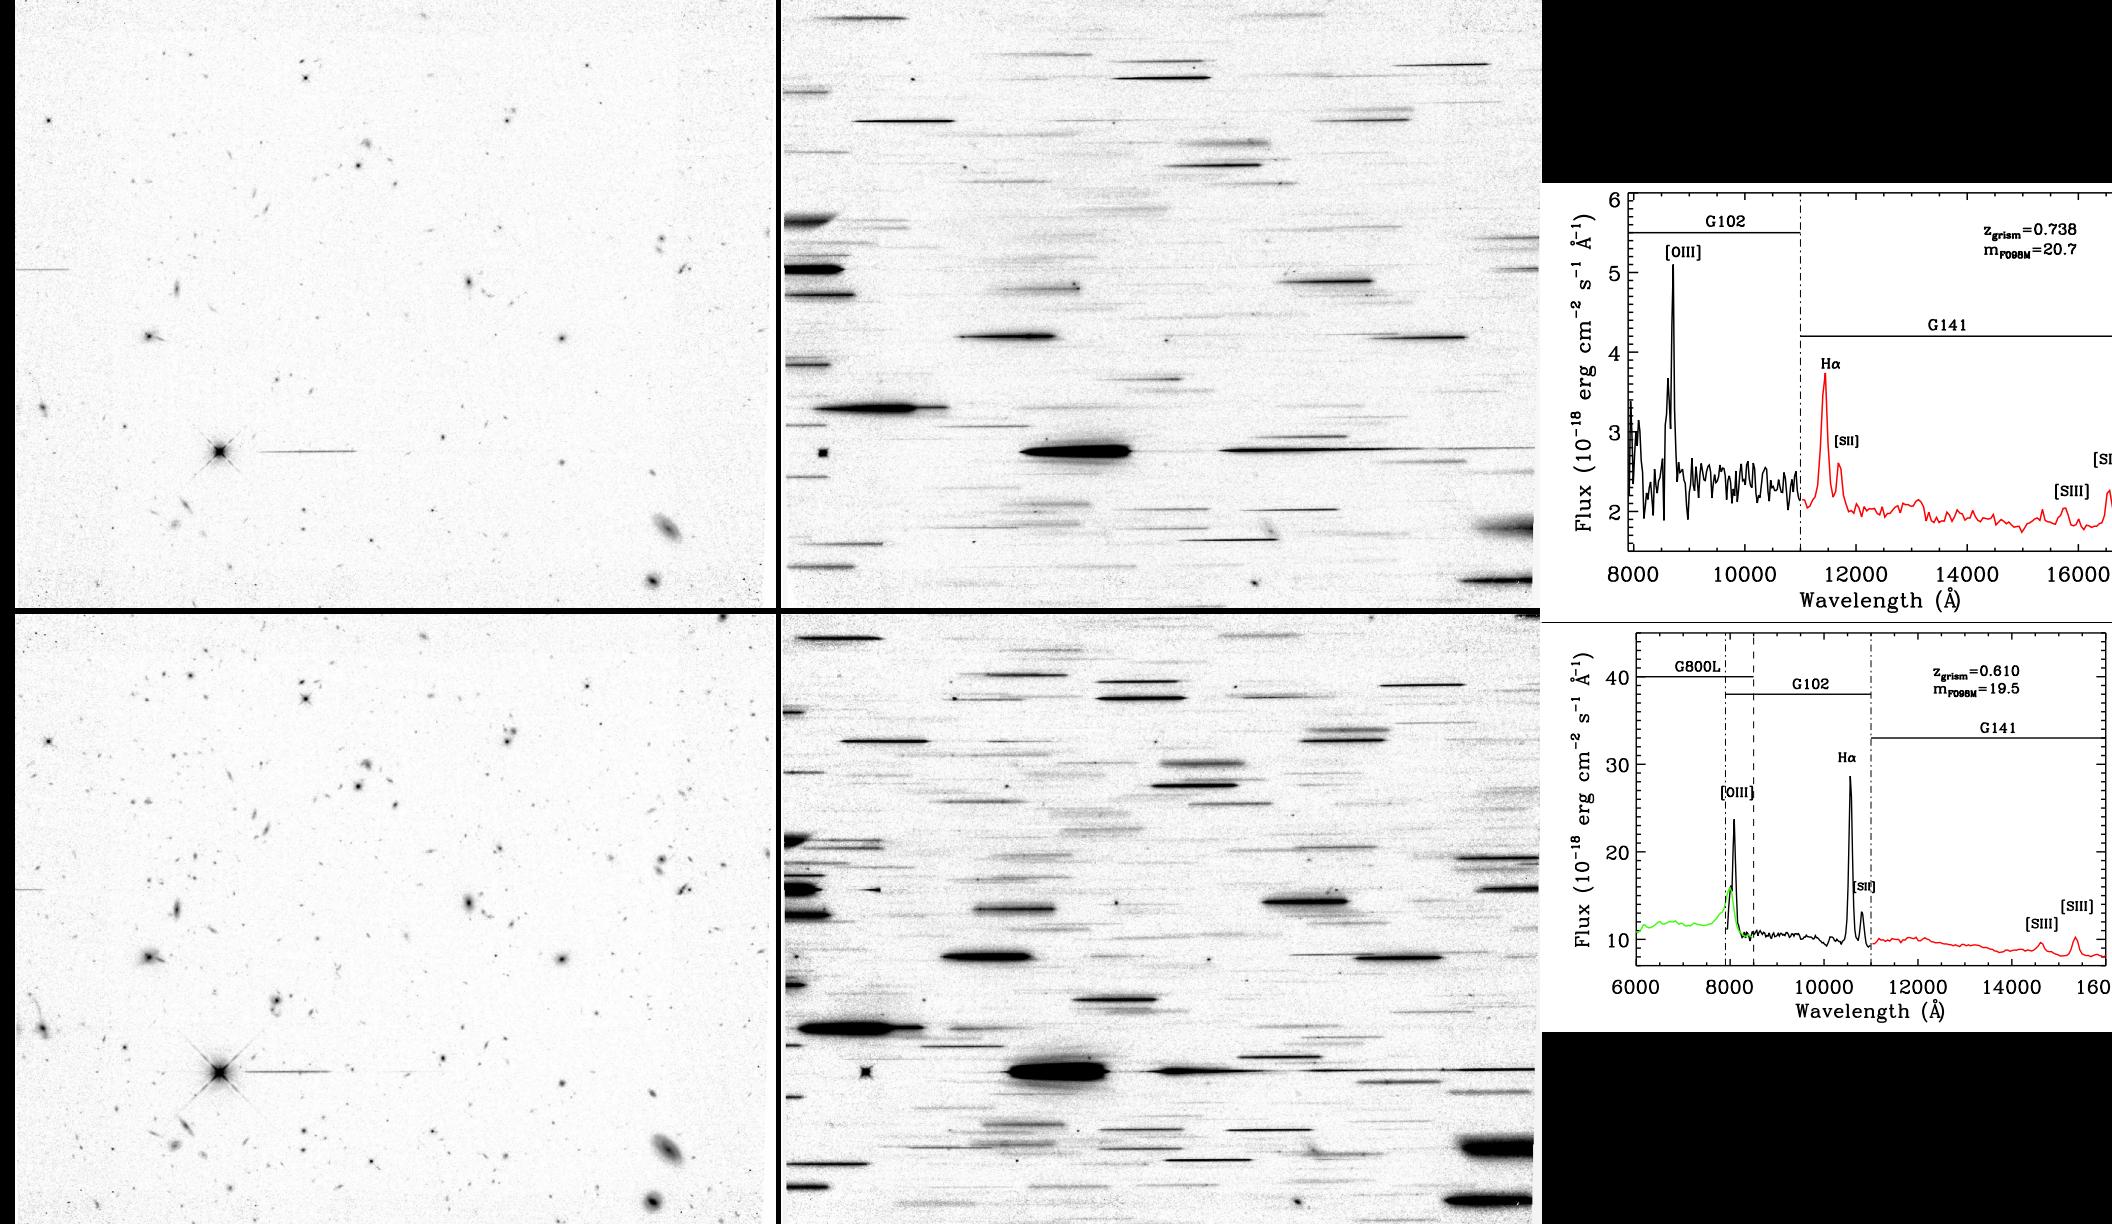

With Hubble UV-optical images as benchmarks, JWST can measure the evolution of galaxy structure & physical properties over a wide range of cosmic time:

- (1) Most spiral disks will dim away at high redshift, but most formed at $z \lesssim 1-2$.

Visible to JWST at very high z are:

- (2) Compact star-forming objects (dwarf galaxies).
- (3) Point sources (QSOs).
- (4) Compact mergers & train-wrecks.

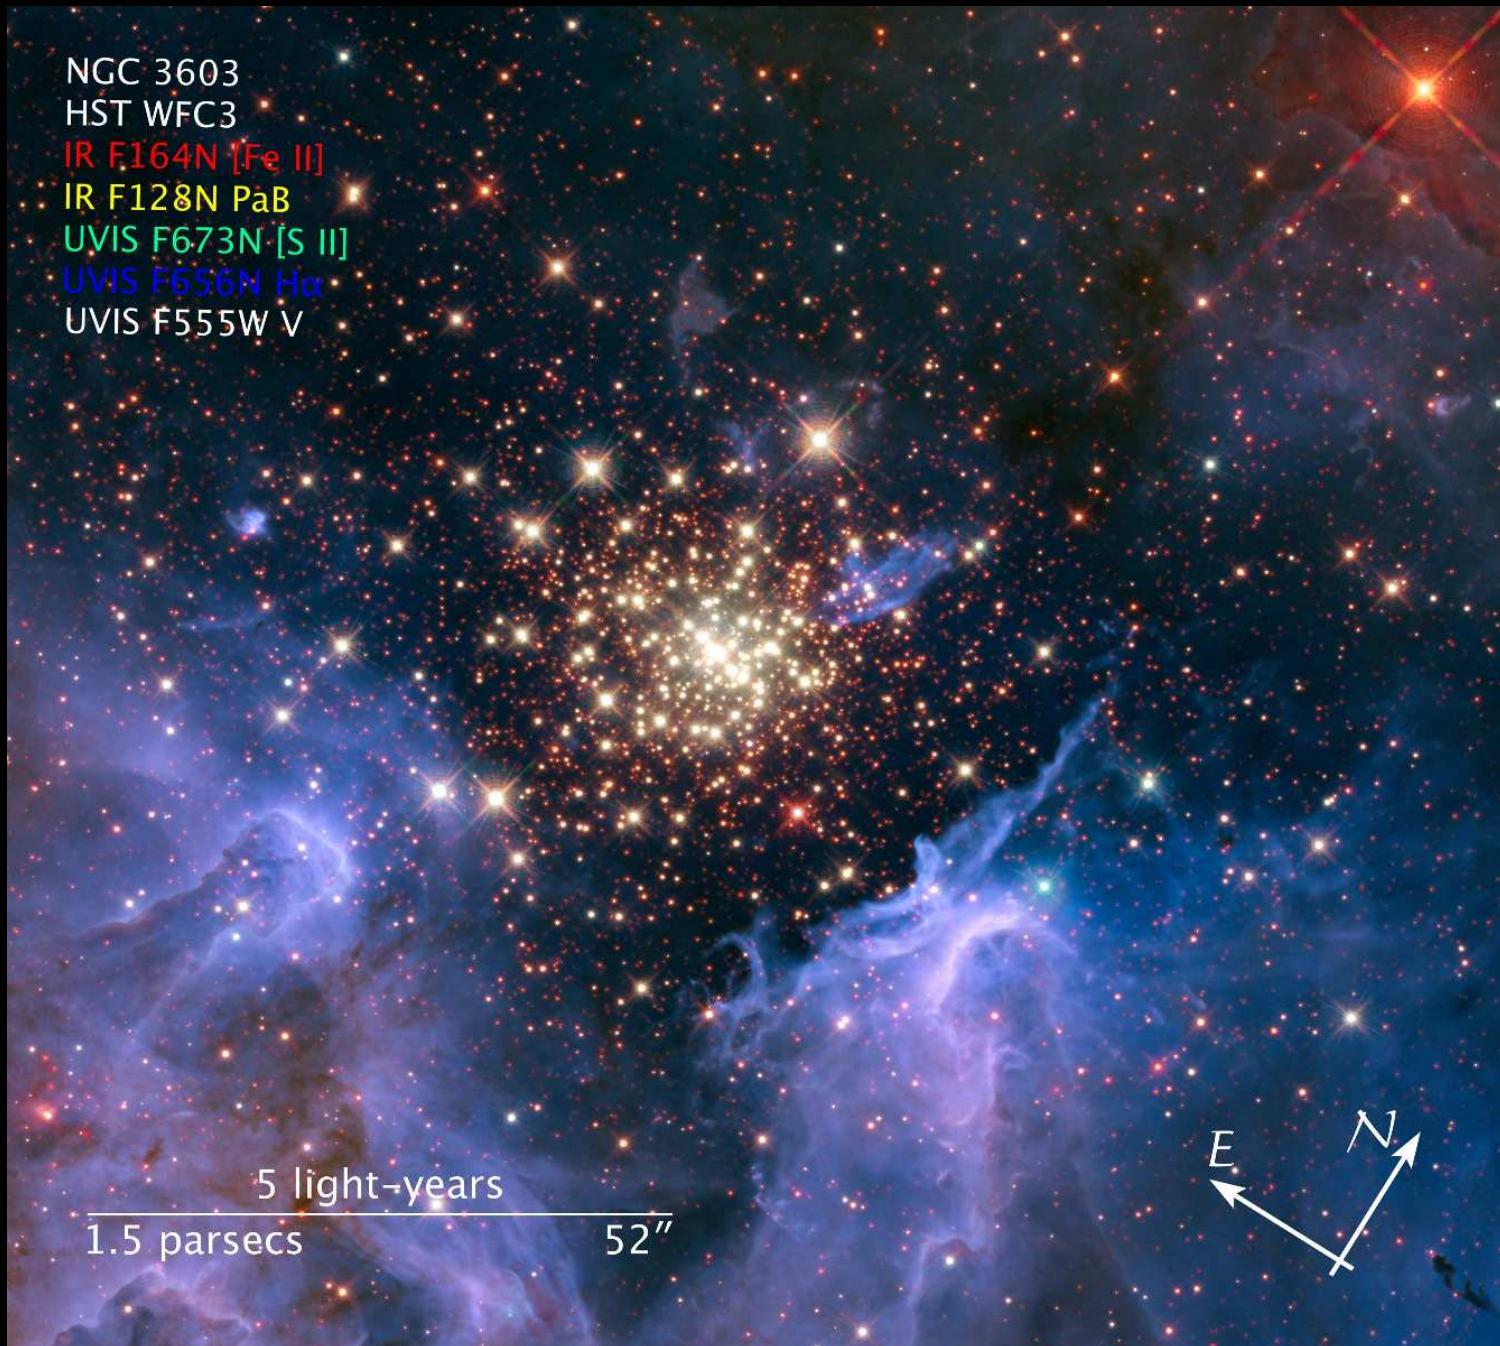

HST/WFC3 G102 & G141 grism spectra in GOODS-S ERS (Straughn⁺ 2010)

IR grism spectra from space: unprecedented new opportunities in astrophysics.

- JWST will provide near-IR grism spectra to AB $\lesssim 29$ mag from 2–5.0 μm .

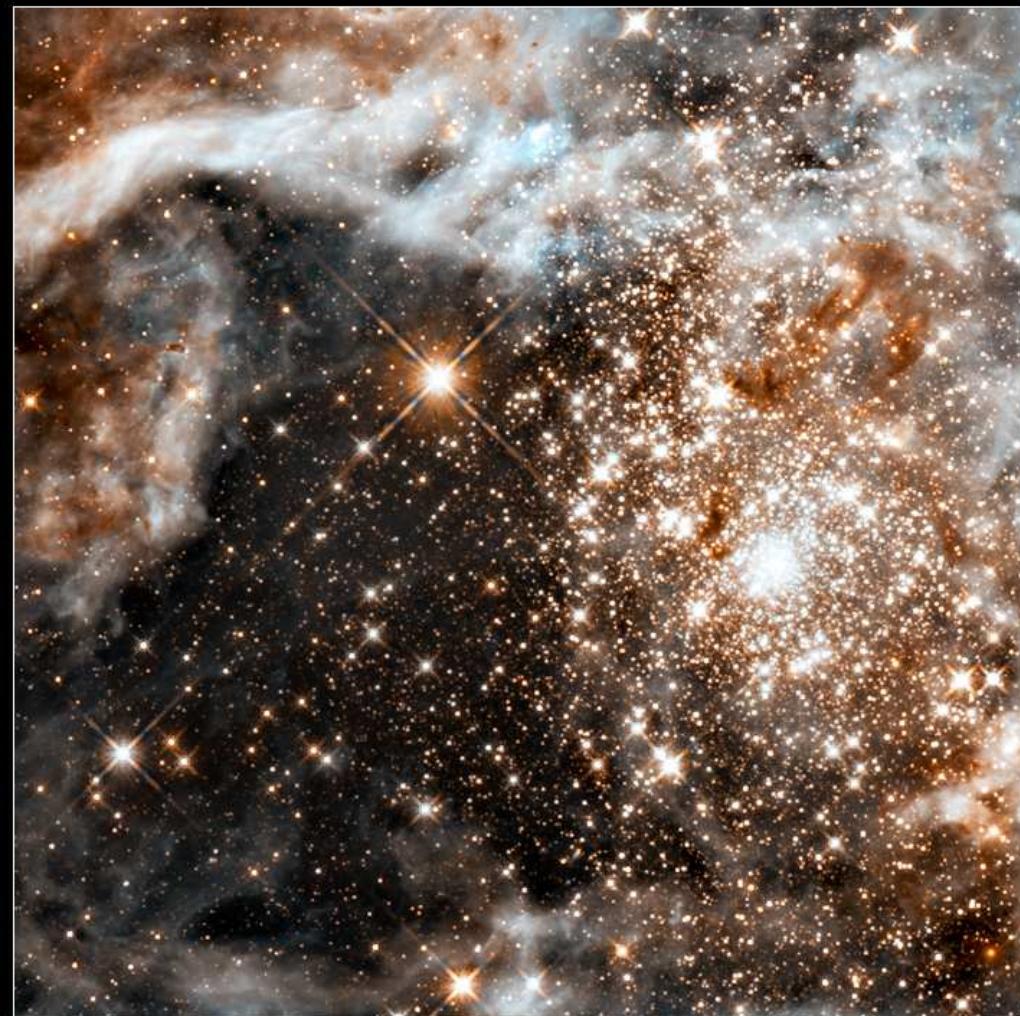

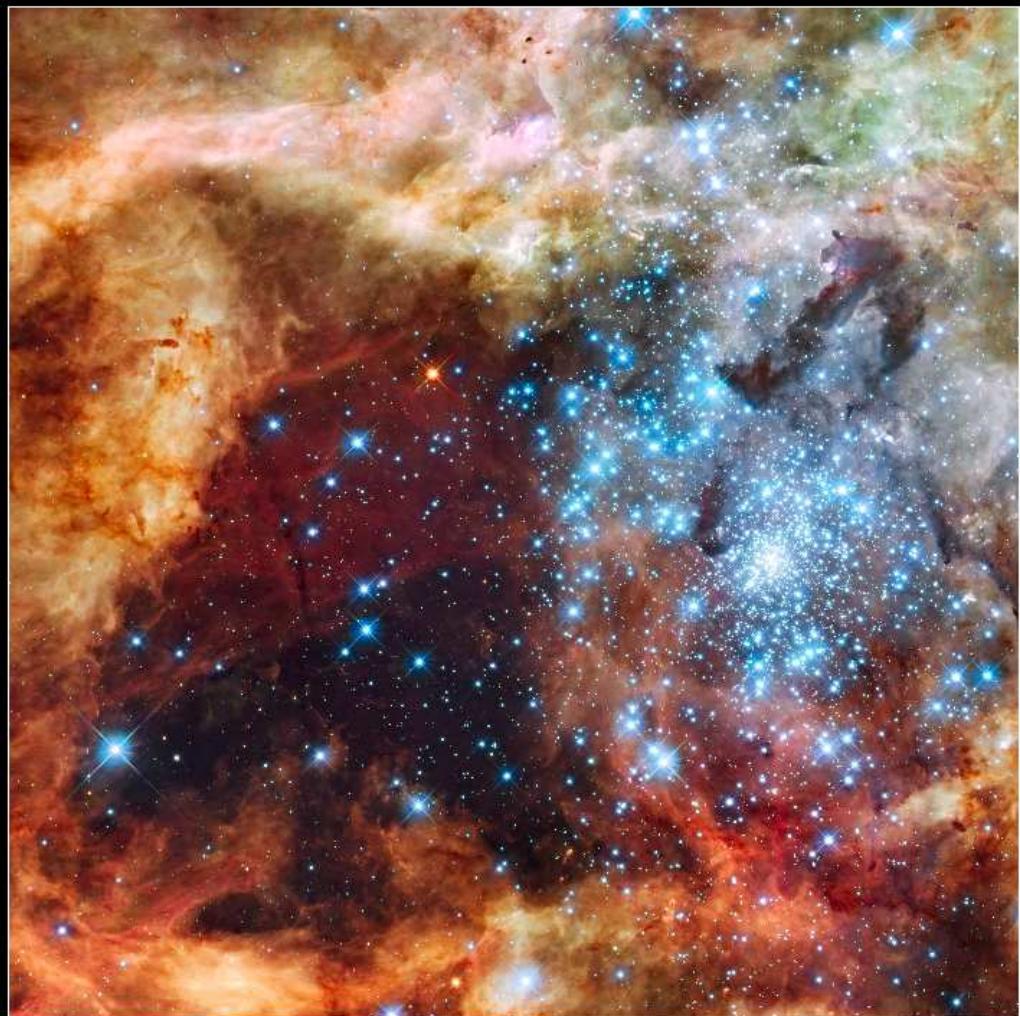

(6) How can JWST measure Earth-like exoplanets?

13

JWST can do very precise photometry of transiting Earth-like exoplanets.

JWST IR spectra can find water and CO₂ in (super-)Earth-like exoplanets.

Transit Spectrum of Habitable “Ocean Planet”

17

JWST IR spectra can find water and CO₂ in transiting Earth-like exoplanets.

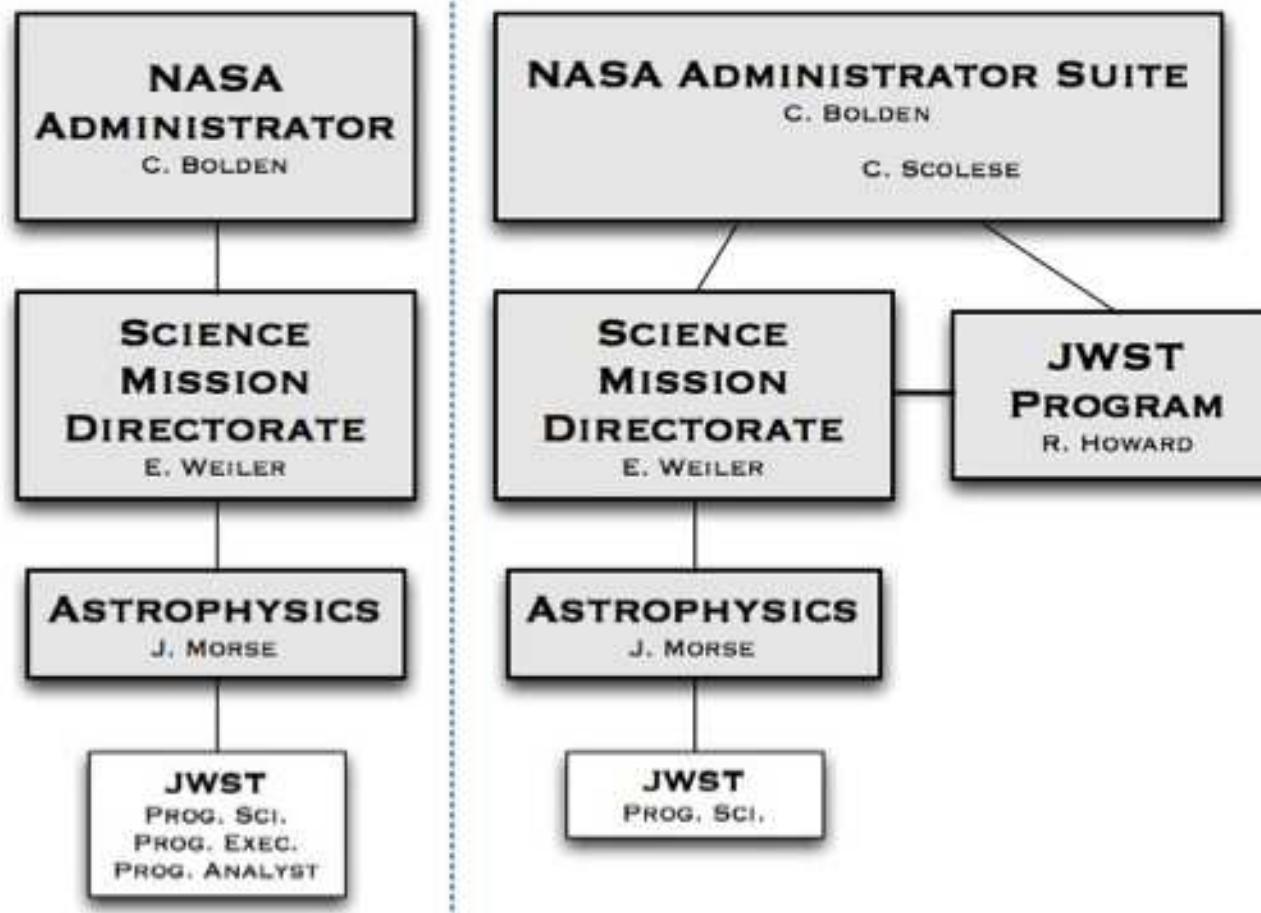

(7) Update of JWST programmaticas as of 2011/2012:

JWST moved out of Astrophysics Division

WAS

IS

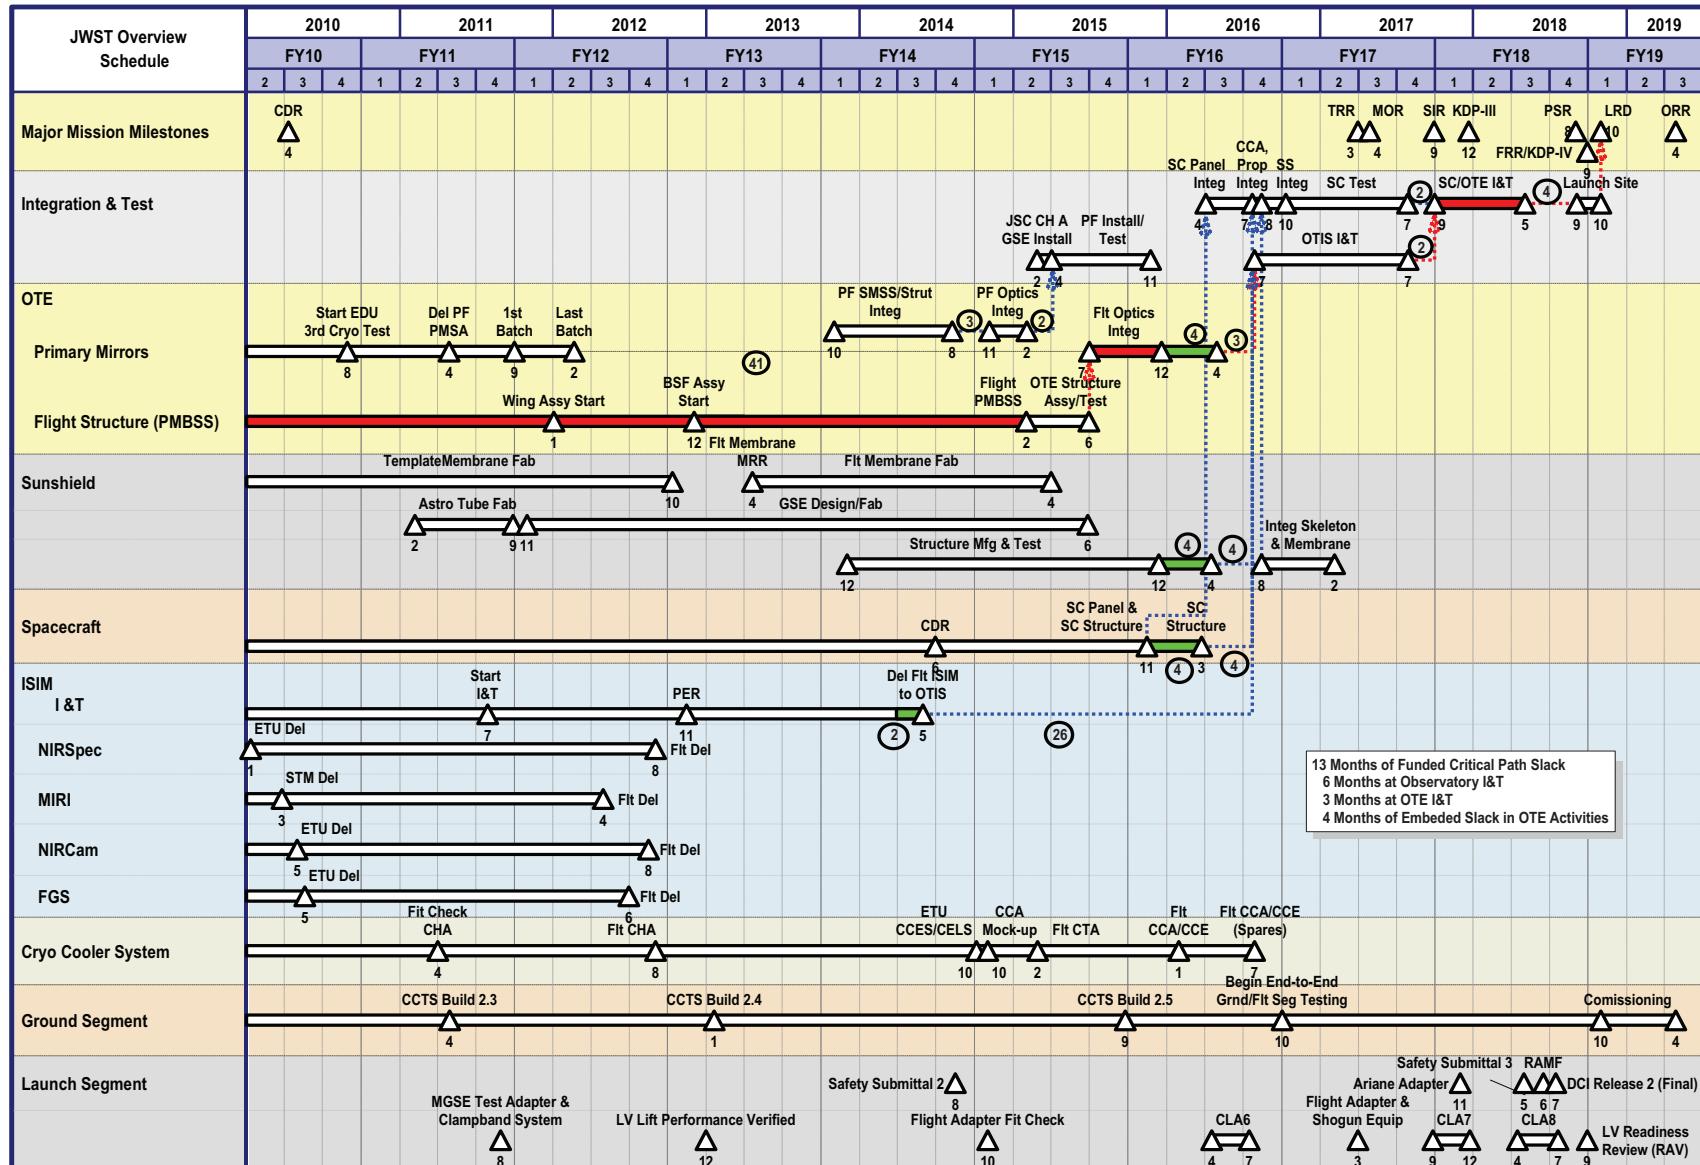

NASA HQ Reorg: JWST budget no longer comes directly from SMD/Ap.

(7) Update of JWST programmaticas as of 2011/2012:

JWST Master Schedule

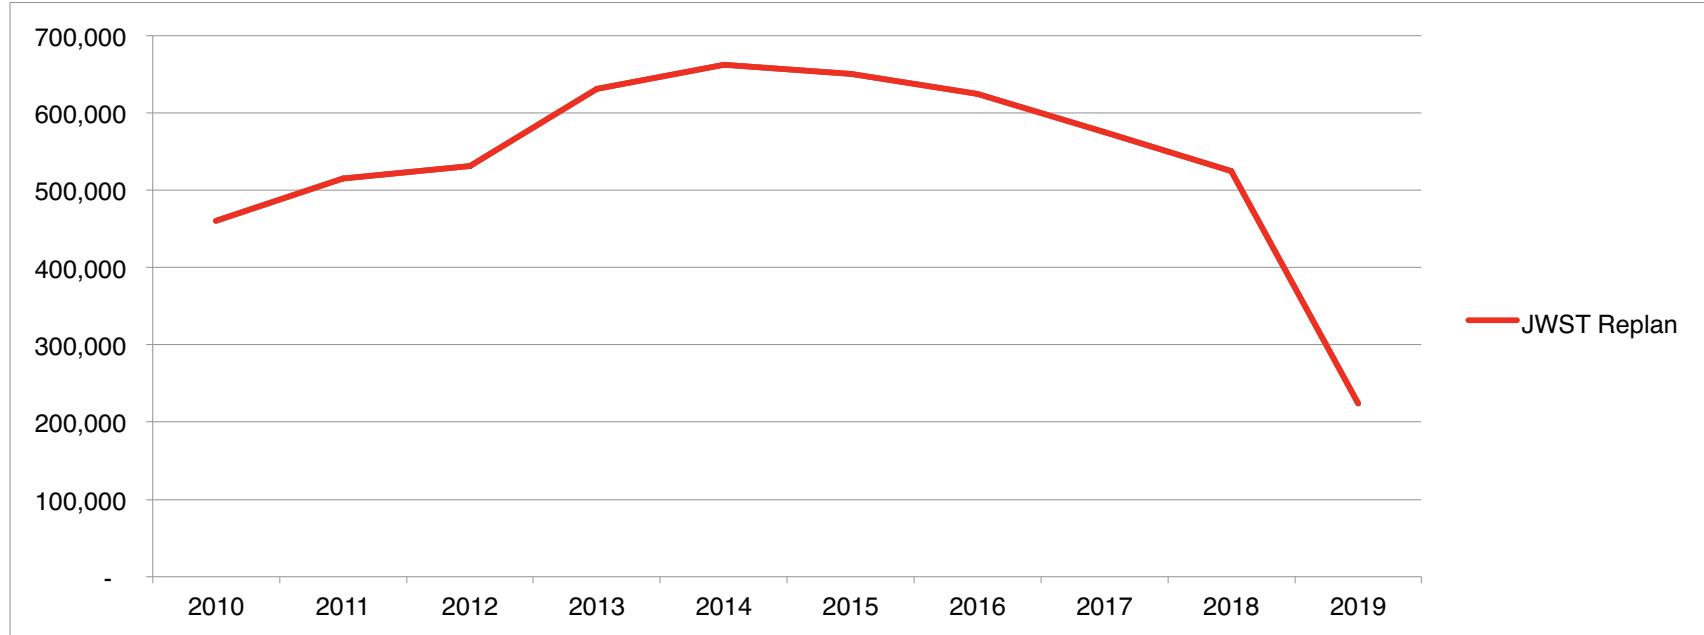

JWST schedule replan for FY12–18 as of 2011 (W. Ochs; NASA GSFC).

(7) Update of JWST programmaticas as of 2011/2012:

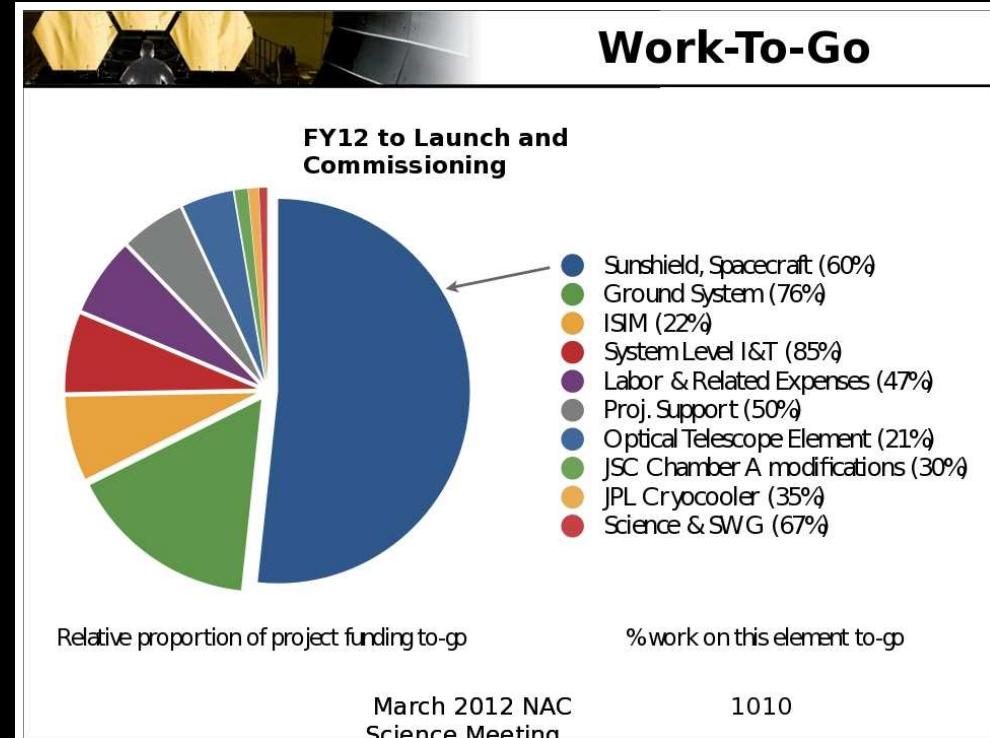

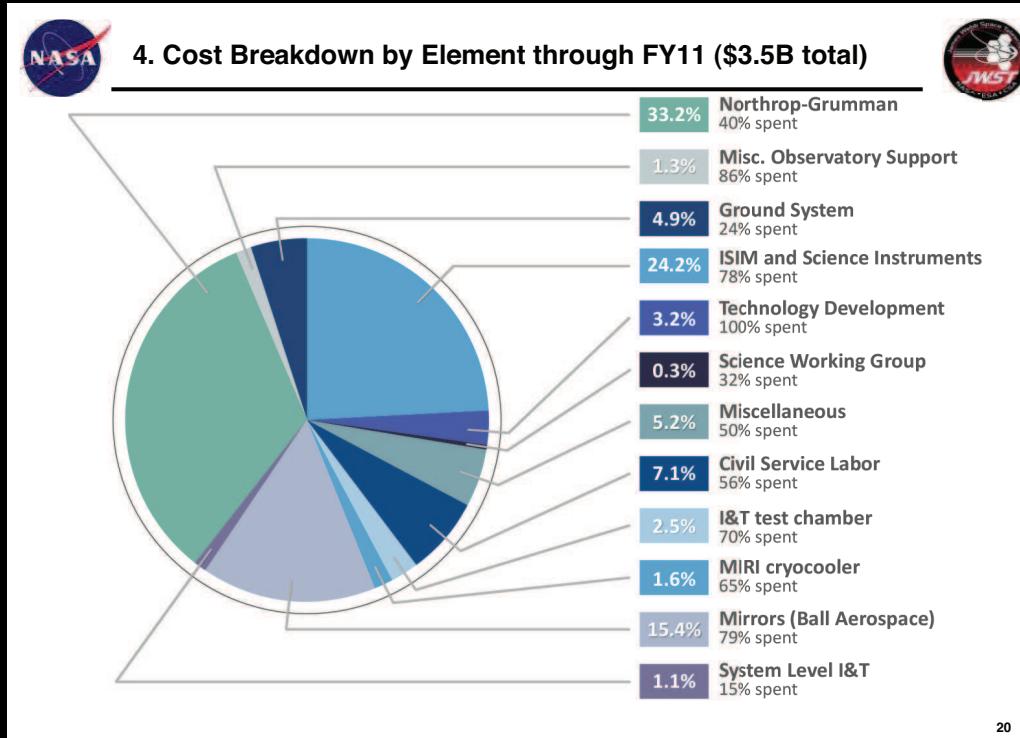

JWST Budget Profile (July 2011)

- **The replan addresses the findings of the SRB and the ICRP report**
 - Avoids making the mistakes identified by ICRP by providing adequate funding in early years
 - Provides a profile that can retire risk earlier by accelerating critical activities

(7) Update of JWST programmaticas as of 2011/2012:

Outcome of 2010 TAT & ICRP reviews and 2011 Project replan (JCL):

(Left) Cost breakdown through FY \leq 11 on each element (as fraction of total Project cost + part thereof spent as of FY11);

(Right) Work-to-go: FY12–FY19 work replanned for each element (as fraction of total cost of each element over length of Project).

- After its 2011 replan, JWST now has a viable path to its 2018 launch.

Northrop Grumman Expertise in Space Deployable Systems

- Over 45 years experience in the design, manufacture, integration, verification and flight operation of spacecraft deployables
- 100% mission success rate, comprising over 640 deployable systems with over 2000 elements

Baseline "Cup Down" Tower Configuration at JSC (Before)

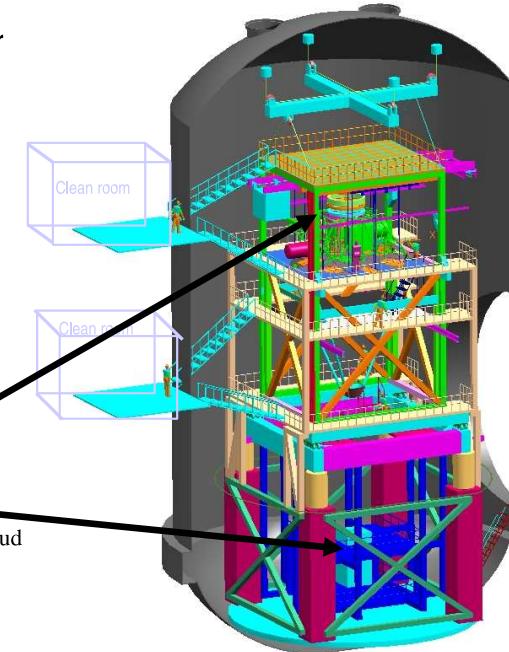

Most recent Tower Design shows an Inner Optical Tower supported by a Outer structure with Vibration Isolation at the midplane. Everything shown is in the 20K region (helium connections, etc. not shown) except clean room and lift fixture.

Current plan calls for 33KW cooldown capability, 12 KW steady state, 300-500mW N2 cooling

JSC currently has 7 KW He capability

Current plan includes 10 trucks of LN2/day during cooldown

Interferometers, Sources, Null Lens and Alignment Equipment Are in Upper and Lower Pressure Tight Enclosure Inside of Shroud

JSC "Cup Up" Test Configuration (New Proposal)

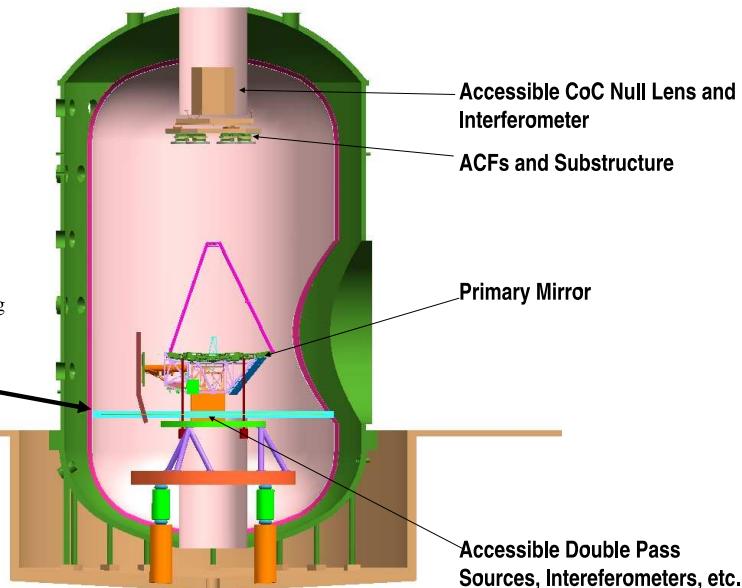

No Metrology Tower and Associated Cooling H/W. External Metrology

Two basic test options:

1. Use isolators, remove drift through fast active control + freeze test equipment jitter
 2. Eliminate vibration isolators (but use soft dampeners) to avoid drift, freeze out jitter
- Builds on successful AMSD heritage of freezing and averaging jitter, testing through windows.

Possible payload "floor" to separate ambient pressure and temperature.

Drawing care of ITT

Page 6

JWST underwent several significant replans and risk-reduction schemes:

- ≈2003: Reduction from 8.0 to 7.0 to 6.5 meter. Ariane-V launch vehicle.
- 2005: Eliminate costly 0.7-1.0 μm performance specs (kept 2.0 μm).
- 2005: Simplification of thermal vacuum tests: cup-up, not cup-down.
- 2006: All critical technology at Technical Readiness Level 6 (TRL-6).
- 2007: Further simplification of sun-shield and end-to-end testing.
- 2008: Passes Mission Preliminary Design & Non-advocate Reviews.
- 2010: Passes Mission Critical Design Review — Replan Int. & Testing.

2. Coarse Alignment Secondary mirror aligned Primary RoC adjusted	 Primary Mirror segments: < 1 mm, < 10 arcsec tilt Secondary Mirror : < 3 mm, < 5 arcmin tilt	WFE < 200 μm (rms)
3. Coarse Phasing - Fine Guiding (PMSA piston)	 WFE: < 250 μm rms	WFE < 1 μm (rms)
4. Fine Phasing	 WFE: < 5 μm (rms)	WFE < 110 nm (rms)
5. Image-Based Wavefront Monitoring	 WFE: < 150 nm (rms)	WFE < 110 nm (rms)

JWST's Wave Front Sensing and Control is similar to the Keck telescope.

In L2, need WFS updates every 10 days depending on scheduling/illumination.

ETU NIRCam

Flight Fine Guidance Sensor

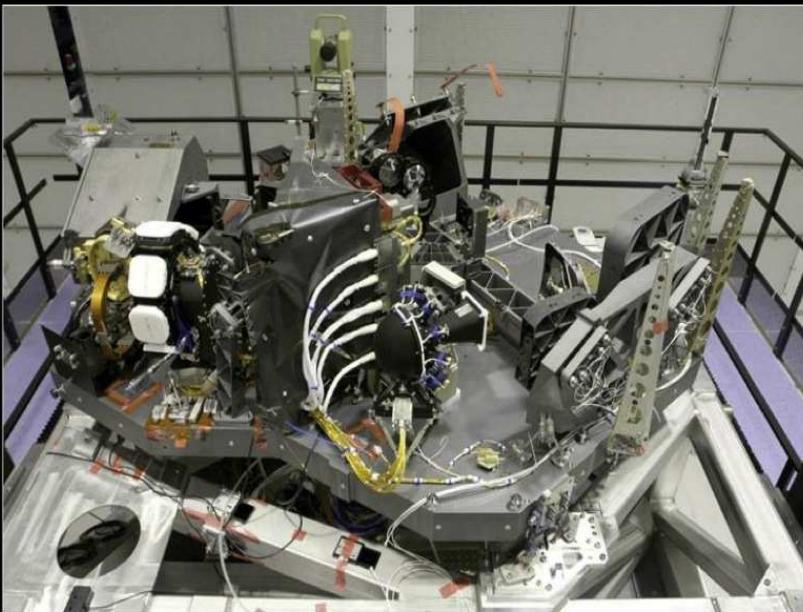

JWST's short-wavelength ($0.6\text{--}5.0\mu\text{m}$) imagers:

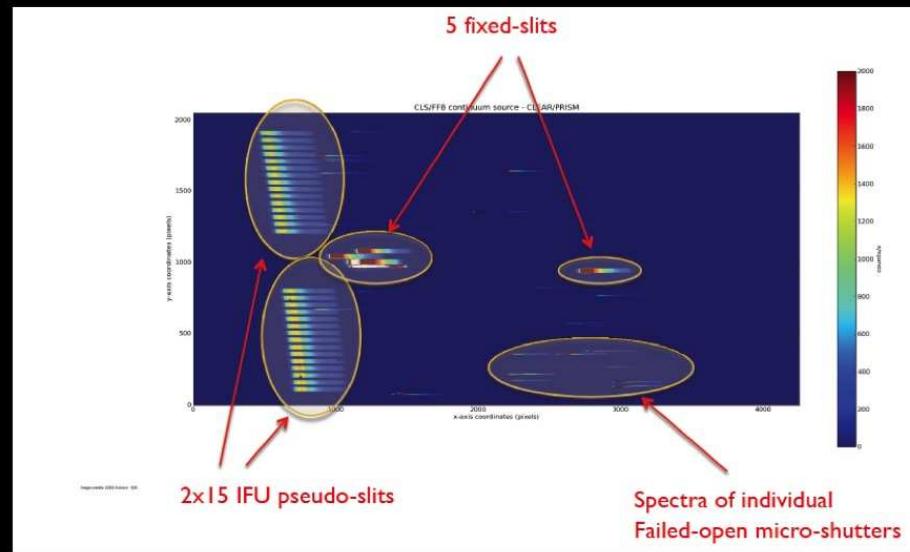

- NIRCam — built by UofA (AZ) and Lockheed (CA).
- Fine Guidance Sensor (& $1\text{--}5\mu\text{m}$ grisms) — built by CSA (Montreal).
- NIRCam scheduled for delivery to GSFC Fall 2011, FGS early 2013.

FLIGHT NIRSpec

Flight NIRSpec First Light

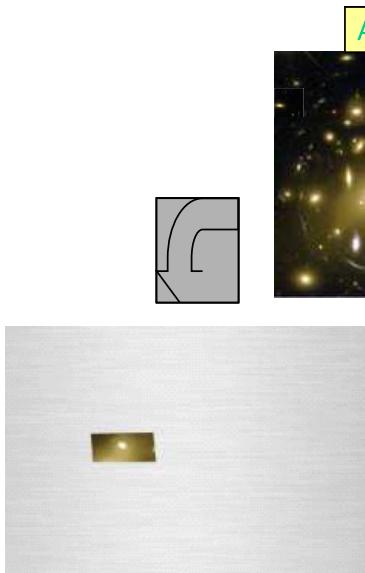

JWST's short-wavelength ($0.6\text{--}5.0\mu\text{m}$) spectrograph:

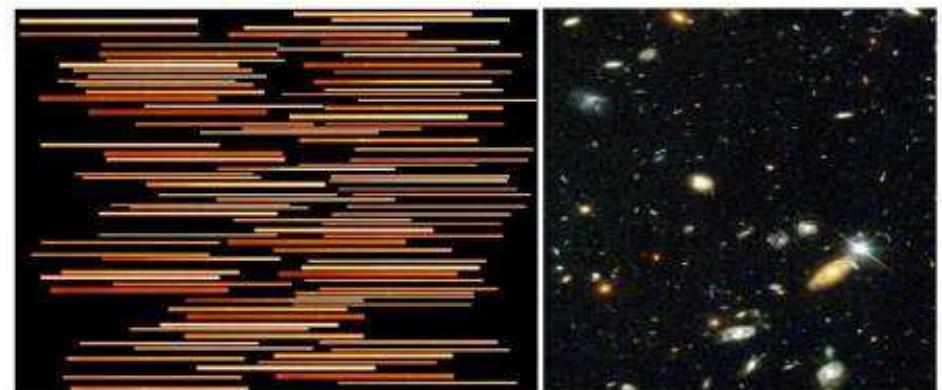

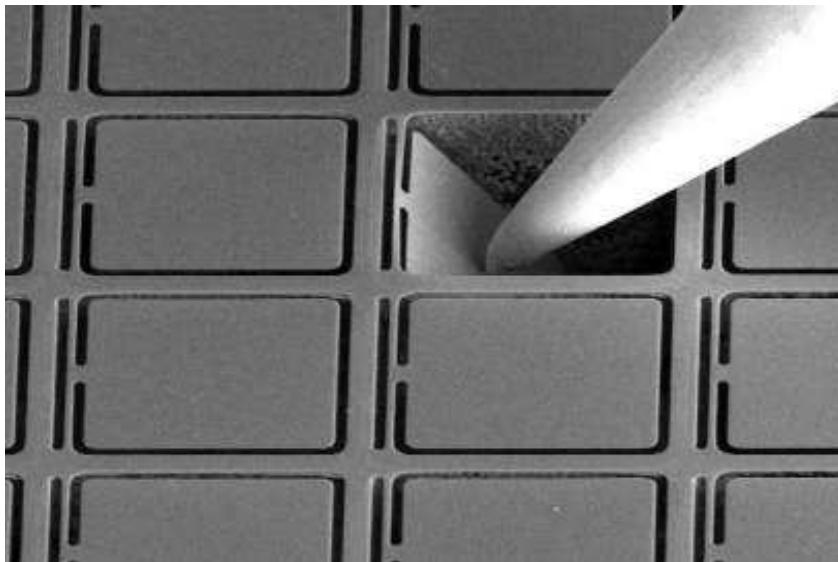

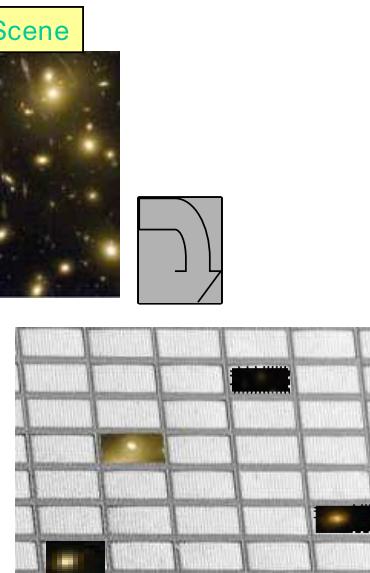

- NIRSpec — built by ESA/ESTEC and Astrium (Munich).
- Flight build completed and tested with First Light in Spring 2011.

Final NIRSpec delivery to NASA/GSFC in early 2013.

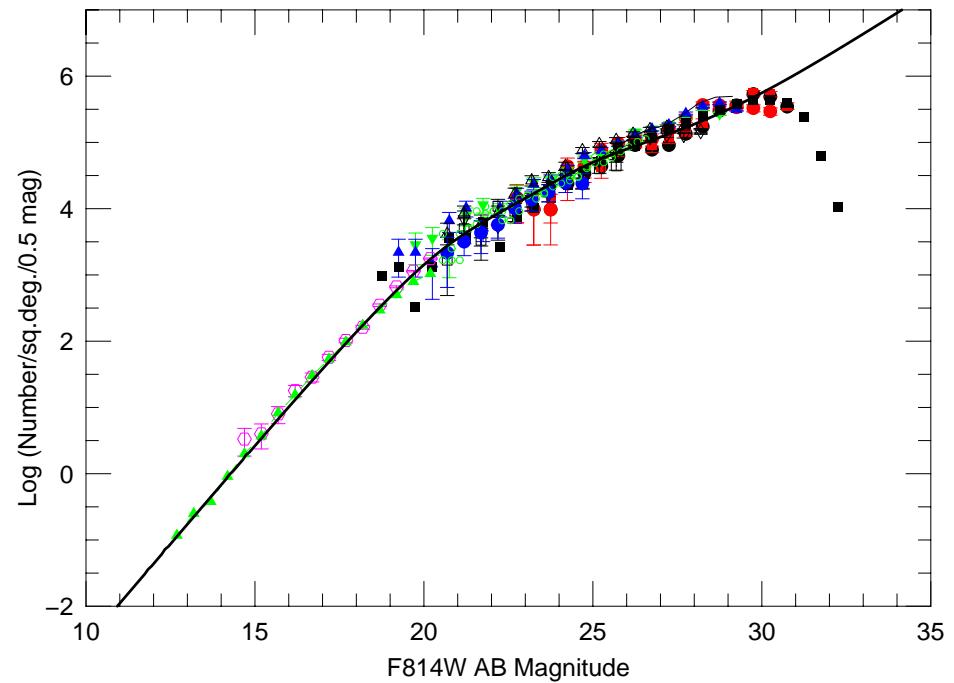

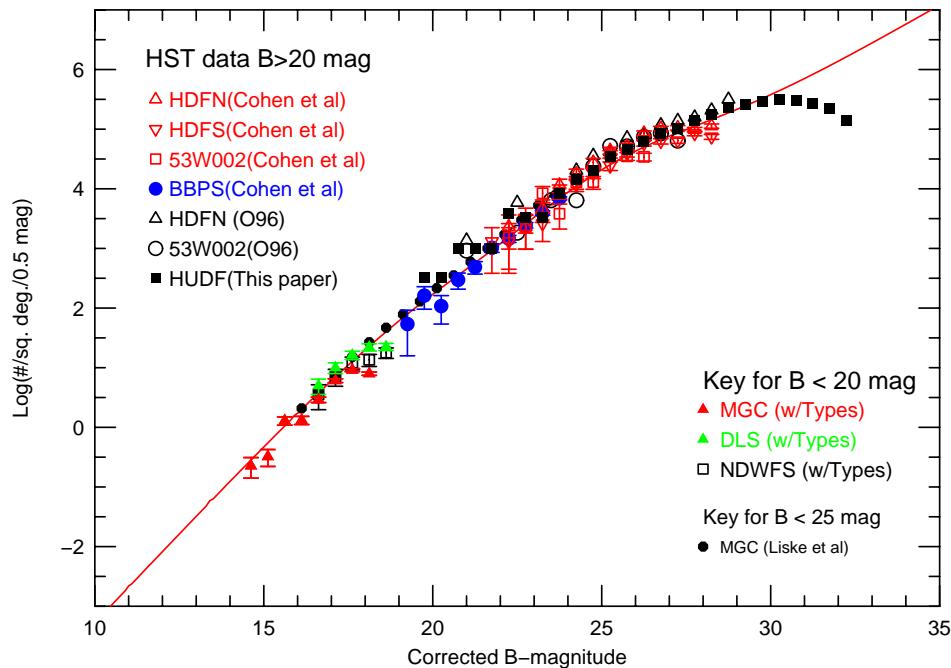

Micro Shutters

Metal Mask/Fixed Slit

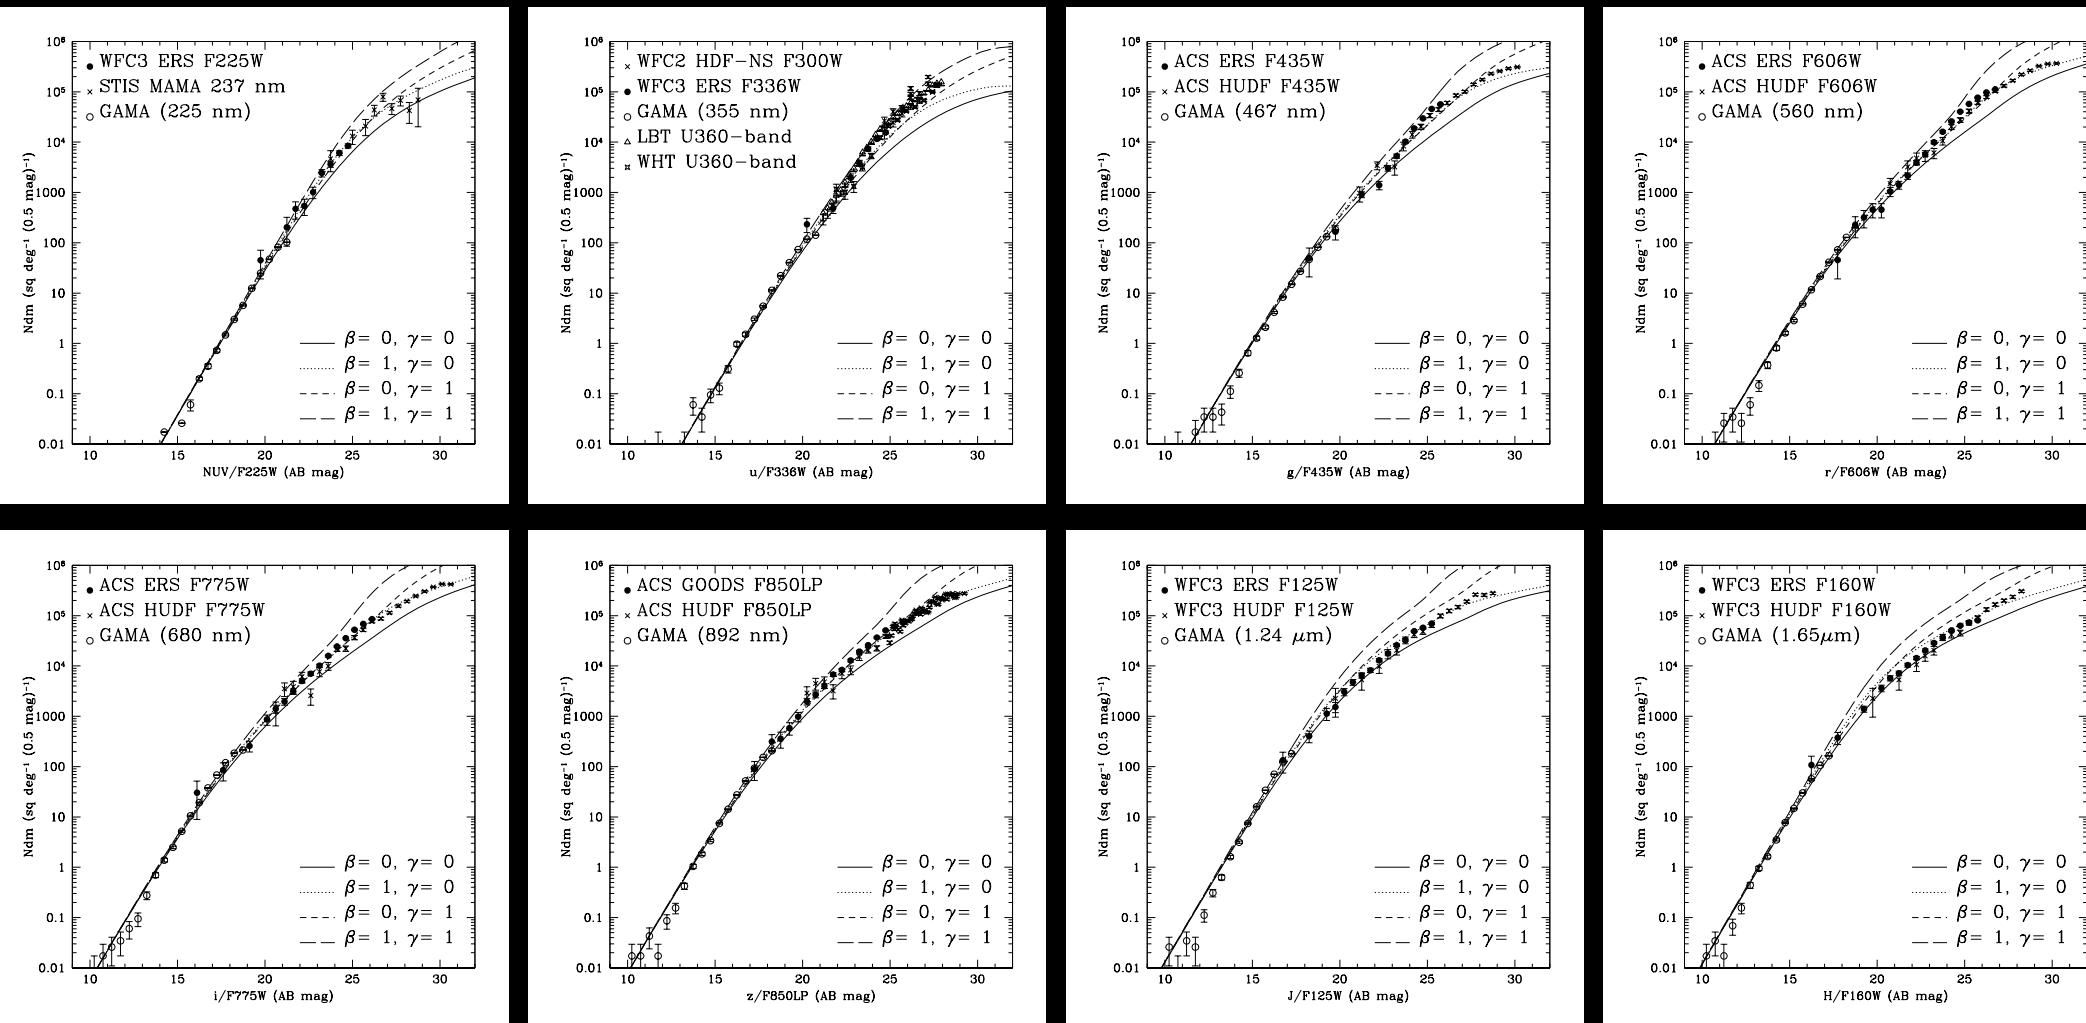

Appendix 1: will JWST (& SKA) reach the Natural Confusion Limit?

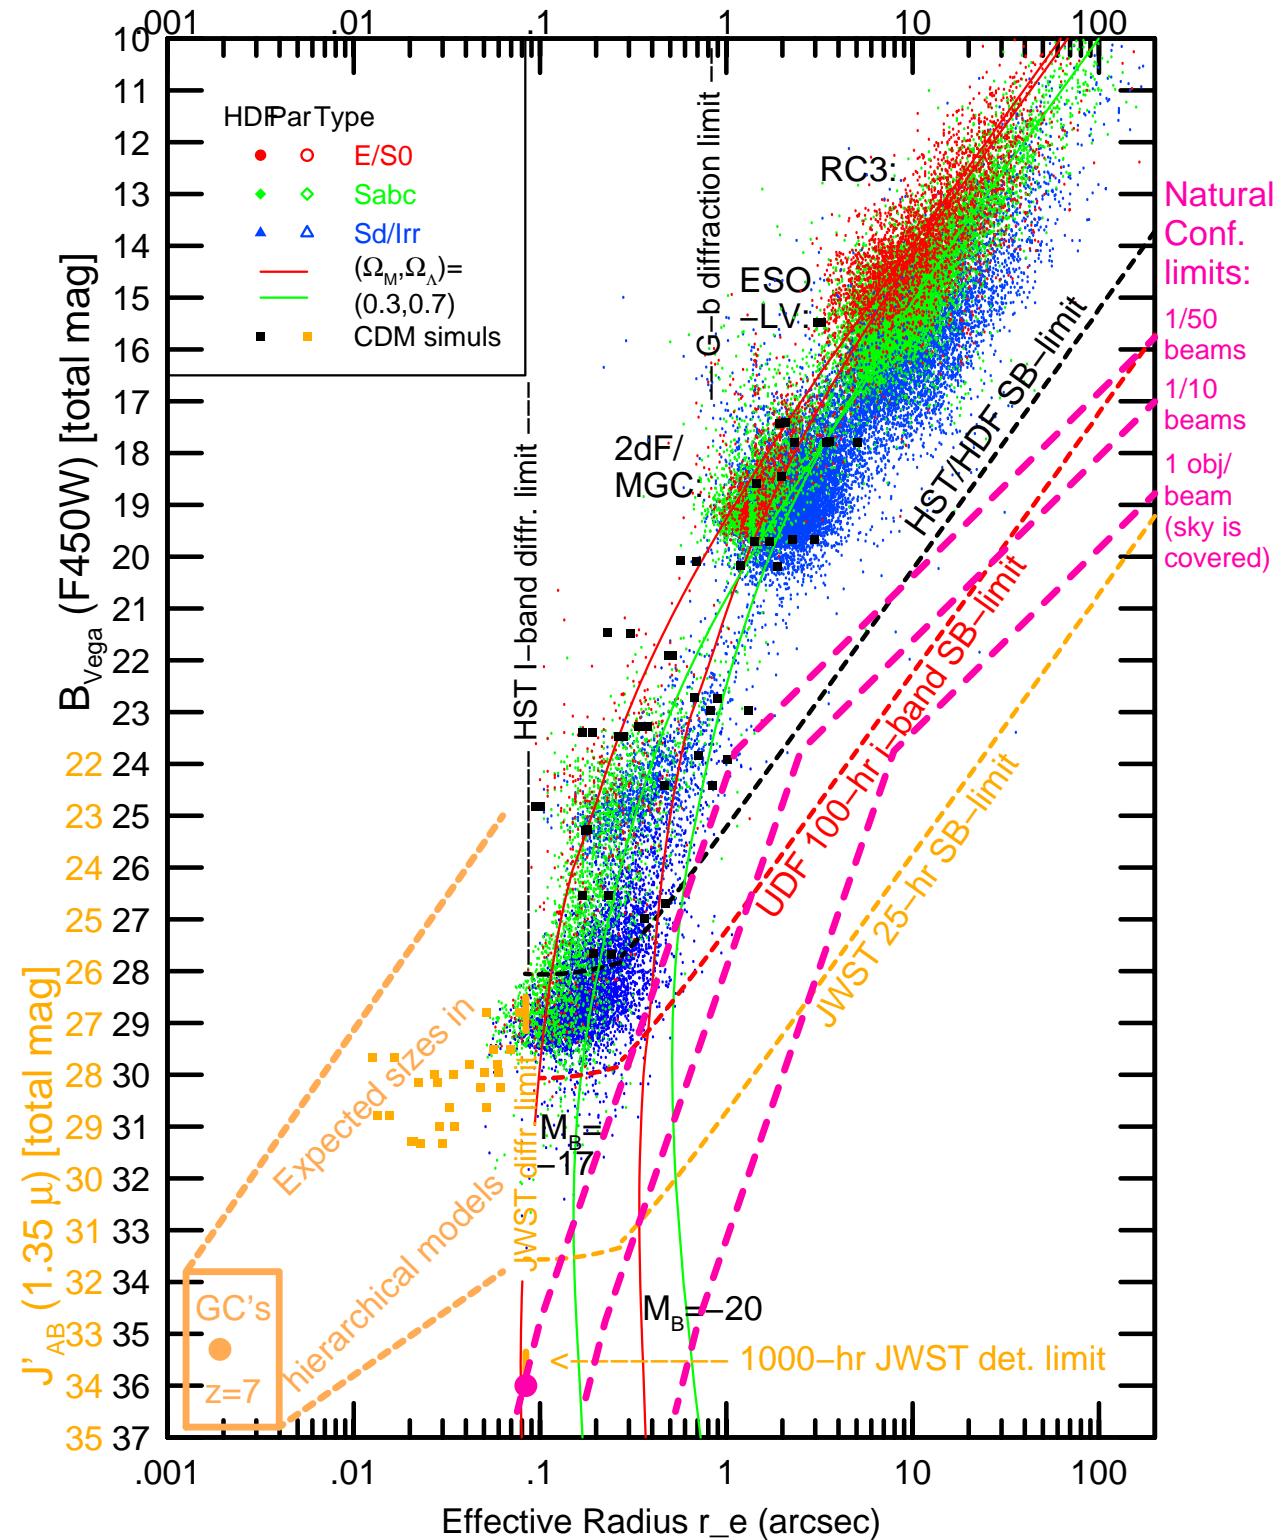

- HUDF galaxy counts (Cohen et al. 2006): expect an integral of $\gtrsim 2 \times 10^6$ galaxies/ deg^2 to AB=31.5 mag ($\simeq 1 \text{ nJy}$ at optical wavelengths). JWST and SKA will see similar surface densities to $\simeq 1$ and 10 nJy , resp.
- ⇒ Must carry out JWST and SKA nJy-surveys with sufficient spatial resolution to avoid object confusion (from HST: this means FWHM $\lesssim 0\farcs08$).
- ⇒ Observe with JWST/NIRSpec/MSA and SKA HI line channels, to disentangle overlapping continuum sources in redshifts space.

Panchromatic Galaxy Counts from $\lambda \simeq 0.2$ – $2\mu\text{m}$ for AB \simeq 10–30 mag

Data: GALEX, ground-based GAMA, HST ERS ACS+WFC3 + HUDF ACS+WFC3 (e.g., Windhorst et al. 2011, ApJS 193, 27):
 Filters: F225W, F275W, F336W, F435W, F606W, F775W, F850LP, F098M/F105W, F125W, F160W.

- No single Lum.+Dens evol model fits over 1 dex in λ and 8 dex in flux.

Combination of ground-based and space-based HST surveys show:

- (1) Apparent galaxy sizes decline from the RC3 to the HUDF limits:
- (2) At the HDF/HUDF limits, this is *not* only due to SB-selection effects (cosmological $(1+z)^4$ -dimming), but also due to:
 - (2a) hierarchical formation causing size evolution:
 $r_{hl}(z) \propto r_{hl}(0) (1+z)^{-1}$
 - (2b) increasing inability of object detection algorithms to deblend galaxies at faint mags (“natural” confusion \neq “instrumental” confusion).
- (3) At AB \gtrsim 30 mag, JWST and at \gtrsim 10 nJy, SKA will see more than 2×10^6 galaxies/deg 2 . Most of these will be unresolved ($r_{hl} \lesssim 0\farcs1$ FWHM (Kawata et al. 2006). Since $z_{med} \simeq 1.5$, this influences the balance of how $(1+z)^4$ -dimming & object overlap affects the catalog completeness.
- For details, see Windhorst, R. A., et al. 2008, Advances in Space Research, Vol. 41, 1965, (astro-ph/0703171) “High Resolution Science with High Redshift Galaxies”
