

How will JWST measure First Light, Galaxy Assembly & Supermassive Blackhole Growth: New Frontiers after Hubble

Rogier Windhorst (ASU) — JWST Interdisciplinary Scientist

Collaborators: S. Cohen, L. Jiang, R. Jansen (ASU), C. Conselice (UK), S. Driver (OZ), & H. Yan (U-MO)

(Ex) ASU Grads: N. Hathi, H. Kim, M. Mechtley, R. Ryan, M. Rutkowski, B. Smith, & A. Straughn

1973~2018⁺;

1996~2029;

2000~2050⁺

2020~2050[?]

Talk at the ASU Undergraduate Seminar AST 394; ASU, Tempe, AZ

Friday Jan. 16, 2015. All presented materials are ITAR-cleared.

Outline

- (1) Brief Update on the James Webb Space Telescope (JWST), 2014.
- (2) What HST WFC3 has done: Measuring Galaxy Assembly and Supermassive Black-Hole Growth
- (3) How can JWST measure the Epochs of First Light & Galaxy Assembly, and Supermassive Black-Hole Growth?
- (4) The Future: Next generation 20-40 meter ground-based telescopes and ATLAST
- (5) Where do our students end-up? Possible NASA Careers
- (6) Summary and Conclusions.

Sponsored by NASA/HST & JWST

Edwin P. Hubble (1889–1953) — Carnegie astronomer

James E. Webb (1906–1992) — Second NASA Administrator

Hubble: Concept in 1970's; Made in 1980's; Operational 1990– \gtrsim 2014.

JWST: The infrared sequel to Hubble from 2018–2023 (–2029?).

**JWST primary
mirror**

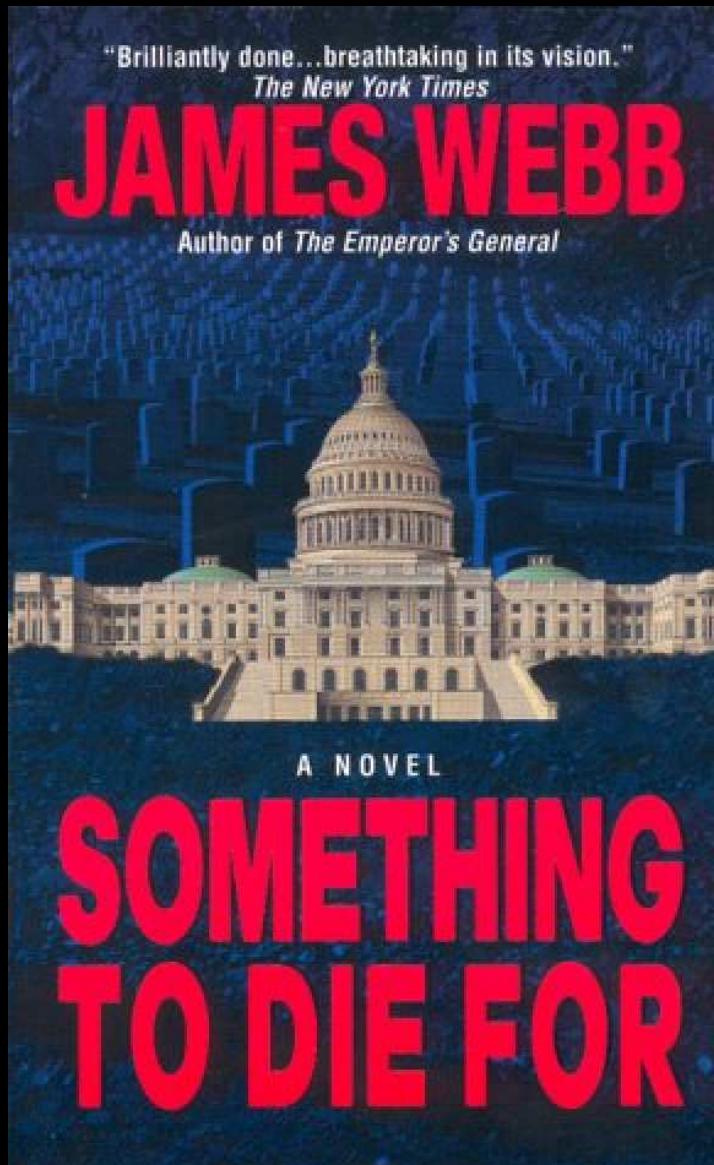

**Hubble primary
mirror**

JWST $\simeq 2.5 \times$ larger than Hubble, so at $\sim 2.5 \times$ larger wavelengths:
JWST has the same resolution in the near-IR as Hubble in the optical.

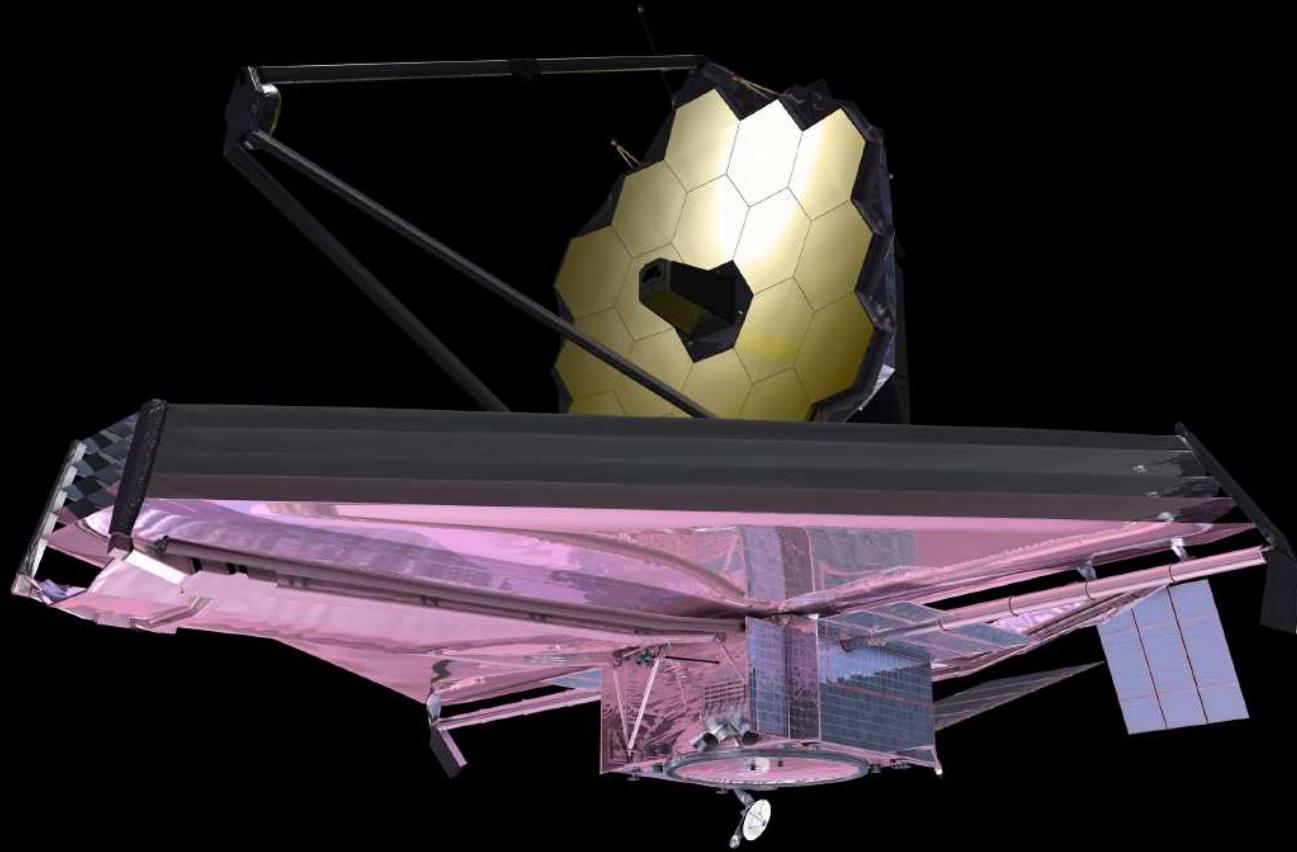

(1) Brief Update of the James Webb Space Telescope (JWST).

To be used by students & scientists after 2018 ... It'll be worth it.

(RIGHT) Life-size JWST prototype on the Capitol Mall, May 2007.

(1) Brief Update of the James Webb Space Telescope

- A fully deployable 6.5 meter (25 m^2) segmented IR telescope for imaging and spectroscopy at $0.6\text{--}28 \mu\text{m}$ wavelength, to be launched in Fall 2018.
- Nested array of sun-shields to keep its ambient temperature at 40 K, allowing faint imaging (AB=31.5 mag) and spectroscopy.

THE JAMES WEBB SPACE TELESCOPE

JWST LAUNCH

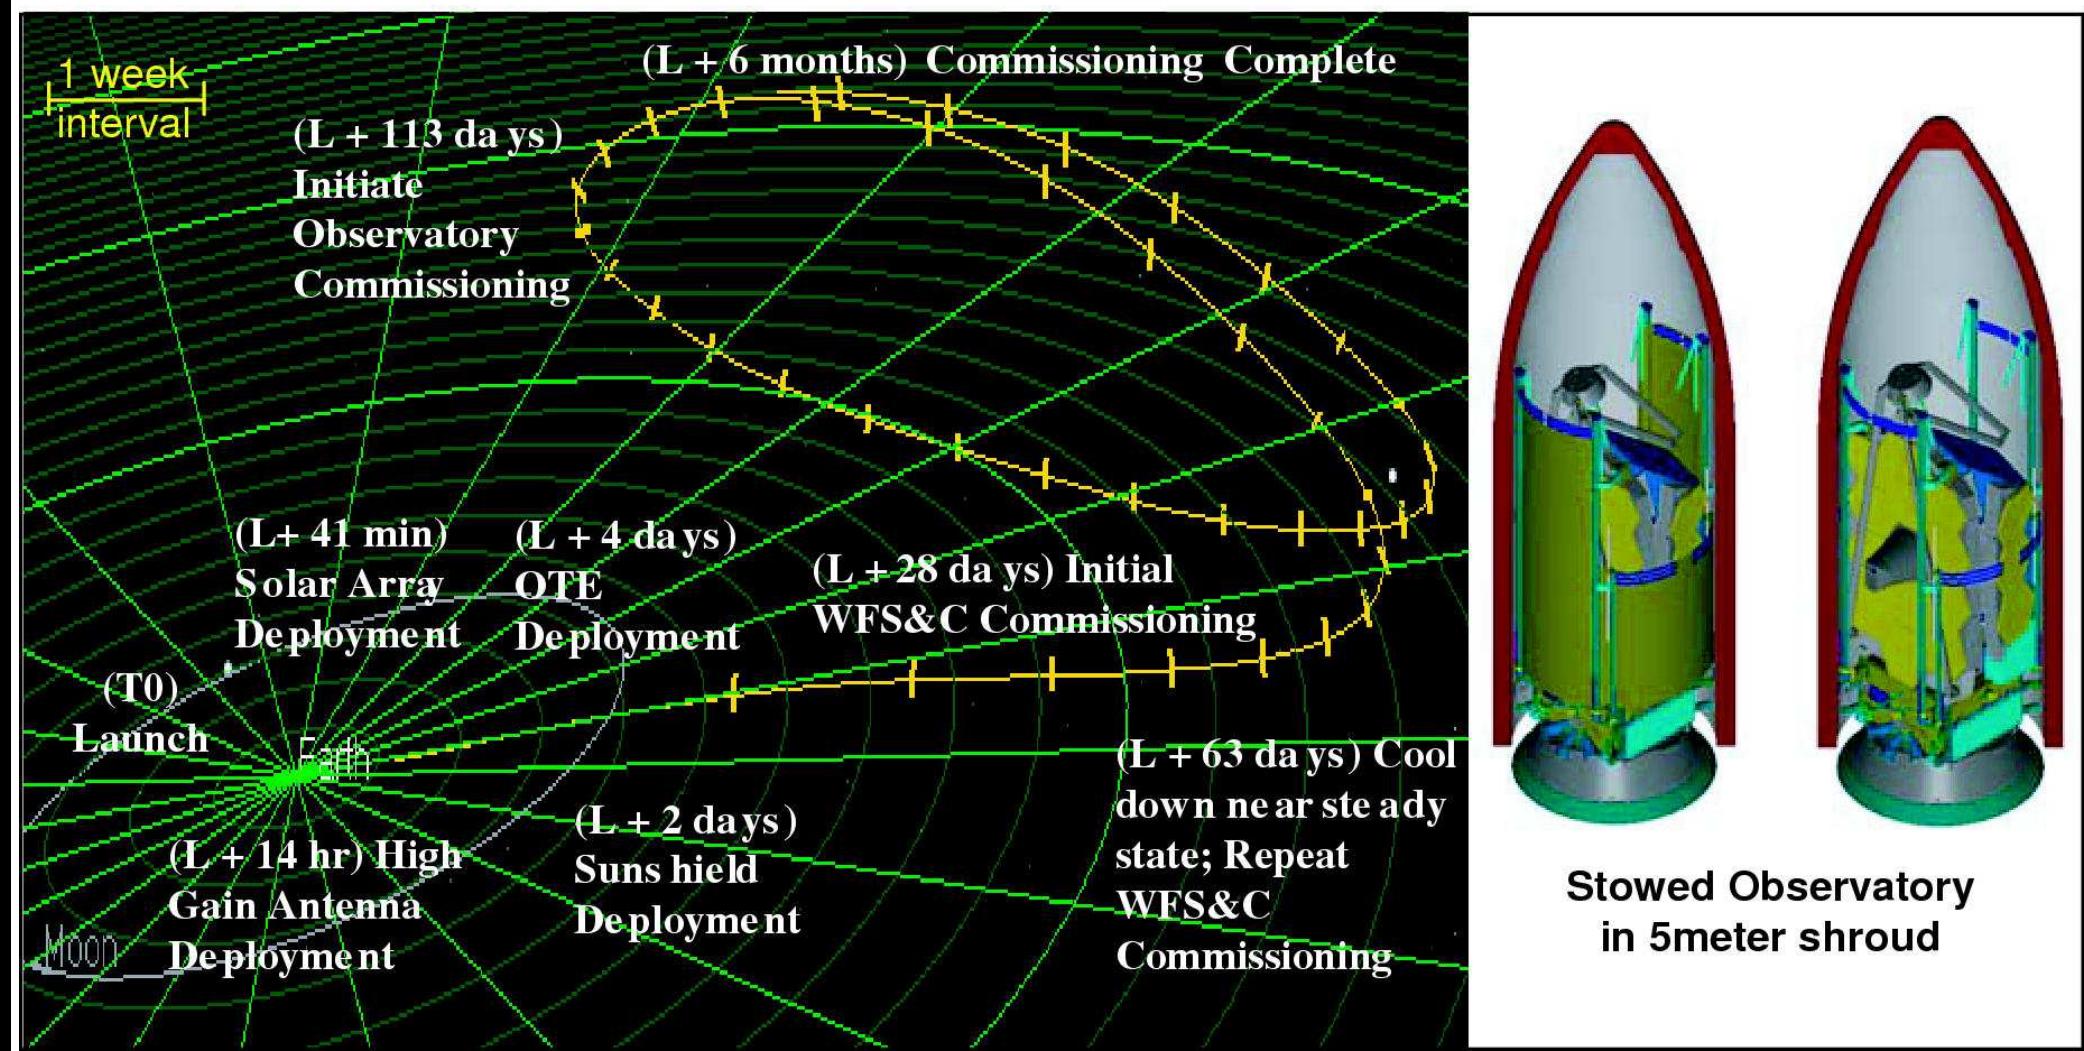

- LAUNCH VEHICLE IS AN ARIANE 5 ROCKET, SUPPLIED BY ESA
- SITE WILL BE THE ARIANESPACE'S ELA-3 LAUNCH COMPLEX NEAR KOUROU, FRENCH GUIANA

ARIANESPACE - ESA - NASA

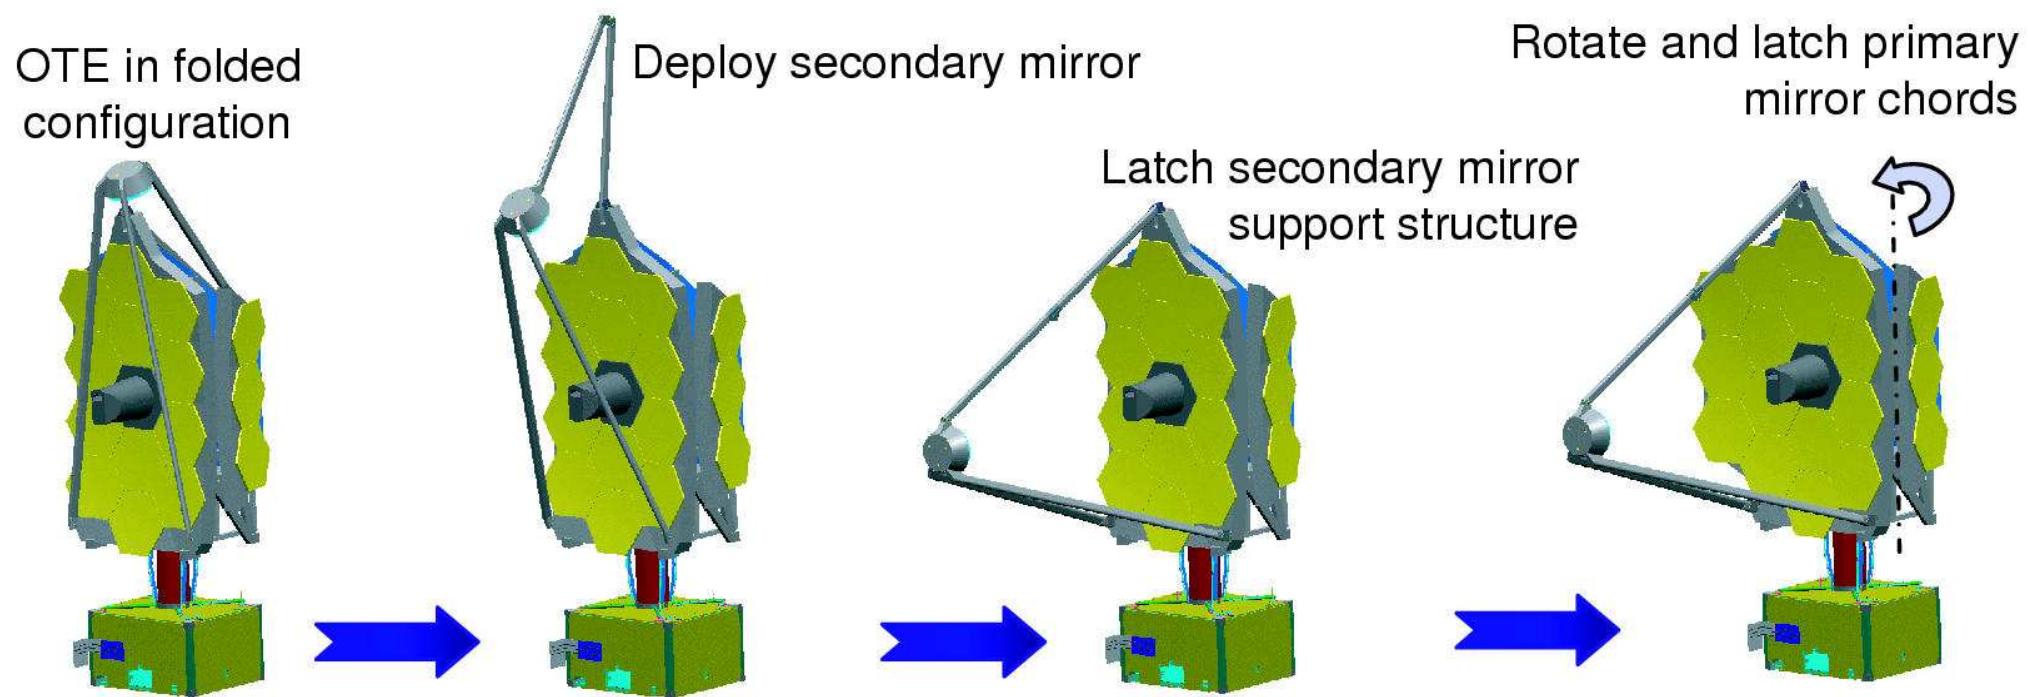

- The JWST launch weight will be $\lesssim 6500$ kg, and it will be launched to L2 with an ESA Ariane-V launch vehicle from Kourou in French Guiana.

(1a) How will JWST travel to its L2 orbit?

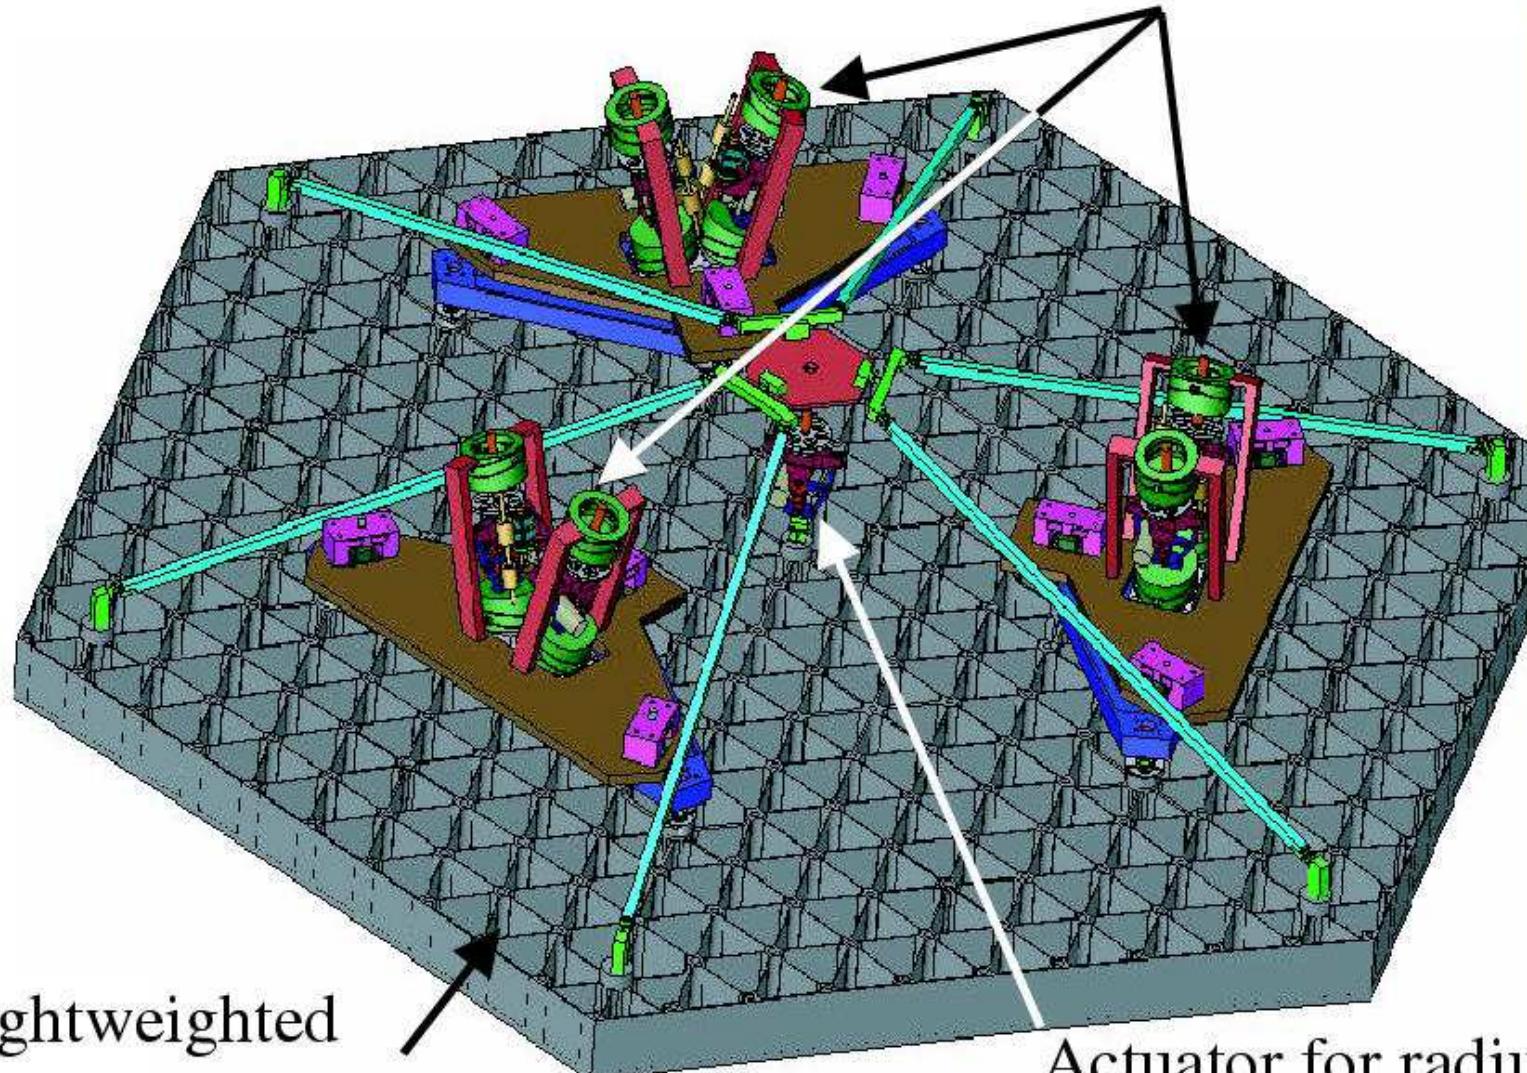

- After launch in (Oct.) 2018 with an ESA Ariane-V, JWST will orbit around the Earth–Sun Lagrange point L2, 1.5 million km from Earth.
- JWST can cover the whole sky in segments that move along with the Earth, observe $\gtrsim 70\%$ of the time, and send data back to Earth every day.

- (1b) How will JWST be automatically deployed?

- During its two month journey to L2, JWST will be automatically deployed, its instruments will be cooled, and be inserted into an L2 orbit.
- The entire JWST deployment sequence is being tested several times on the ground — but only in 1-G: component and system tests in 2014–2016 at GSFC (MD), Northrop (CA), and JSC (Houston).
- Component fabrication, testing, & system integration is on schedule: 18 out of 18 flight mirrors completely done, and meet the 40K specifications.

Actuators for 6 degrees of freedom rigid body motion

Actuator
development
unit

Lightweighted
Beryllium Mirror

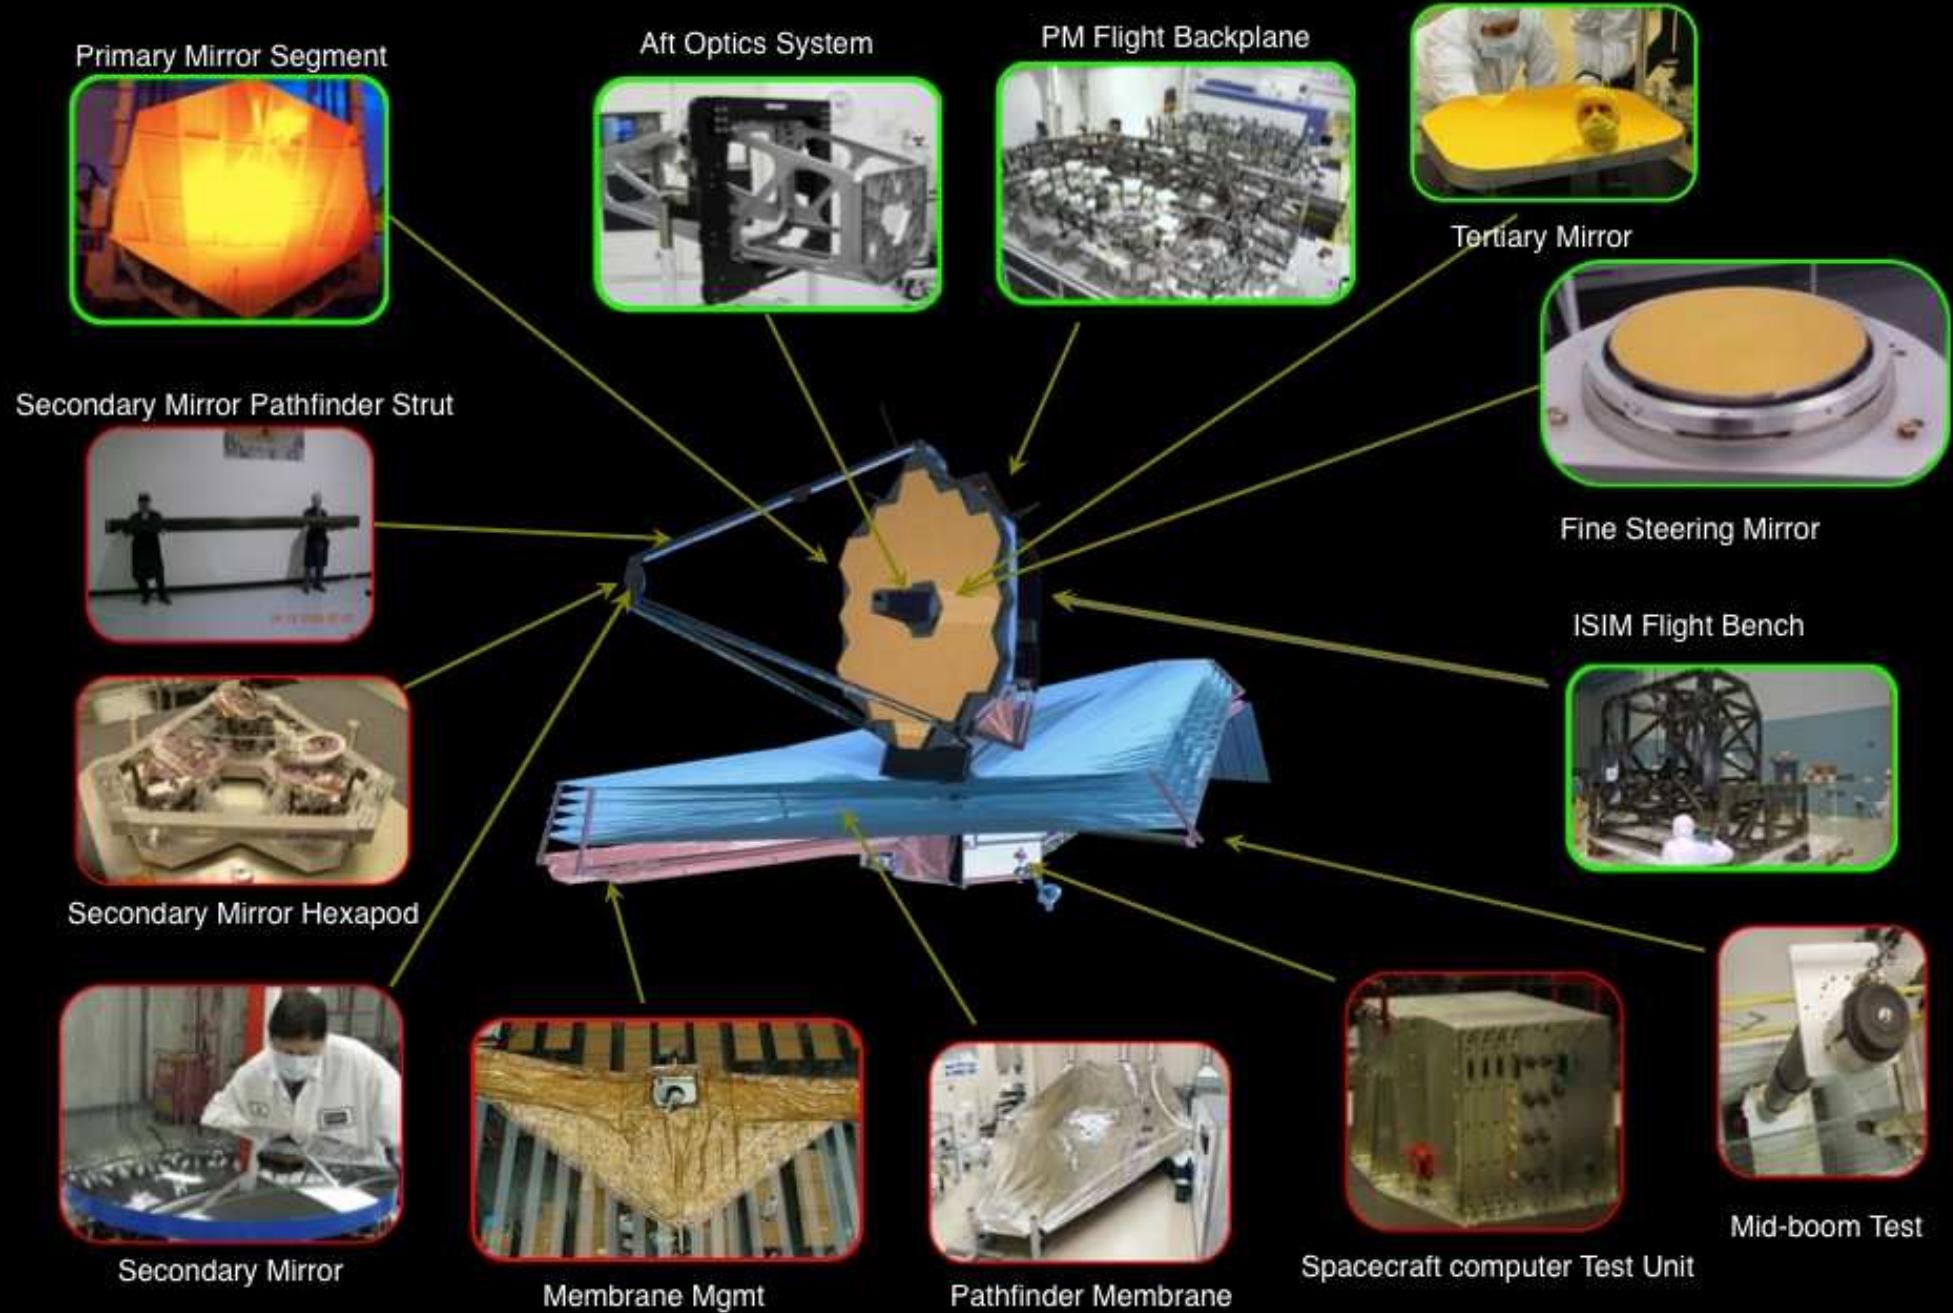

Actuator for radius
of curvature adjustment

Active mirror segment support through “hexapods”, similar to Keck.

Redundant & doubly-redundant mechanisms, quite forgiving against failures.

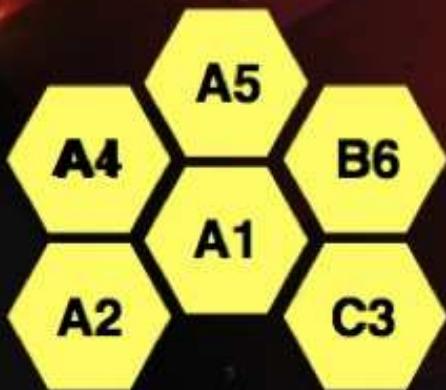

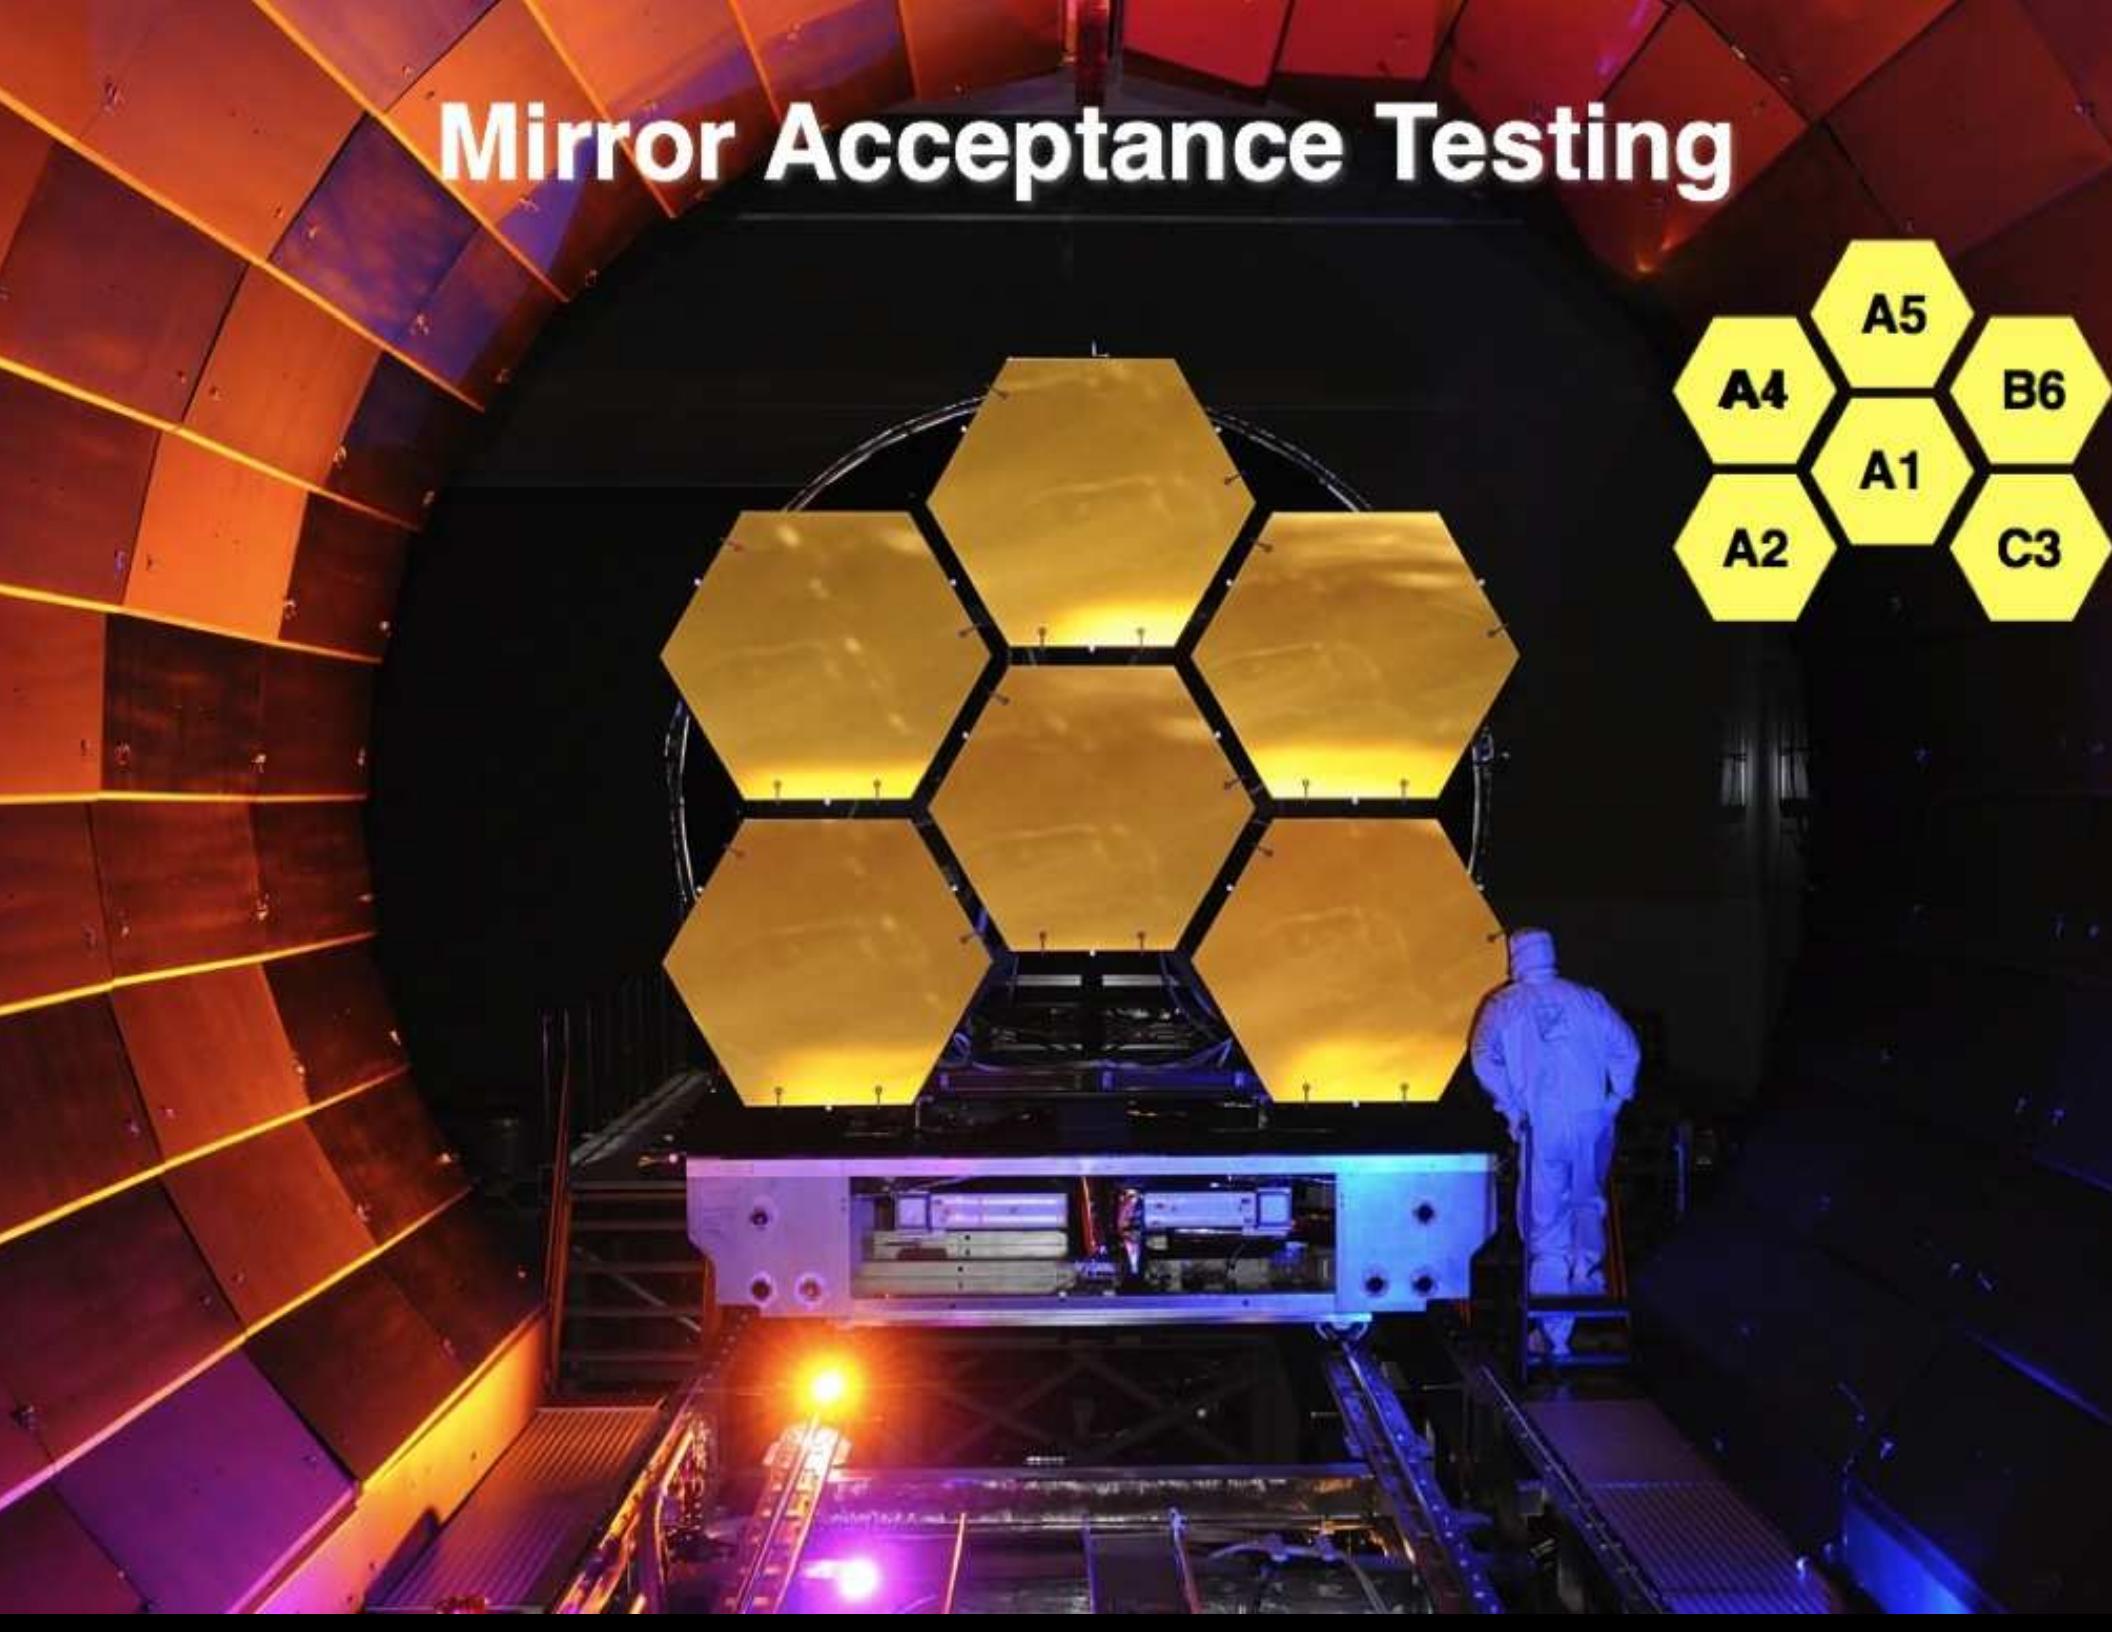

JWST Hardware Status

July 2014: $\geq 97.4\%$ of launch mass ³ designed and built ($\geq 60\%$ weighed).

Mirror Acceptance Testing

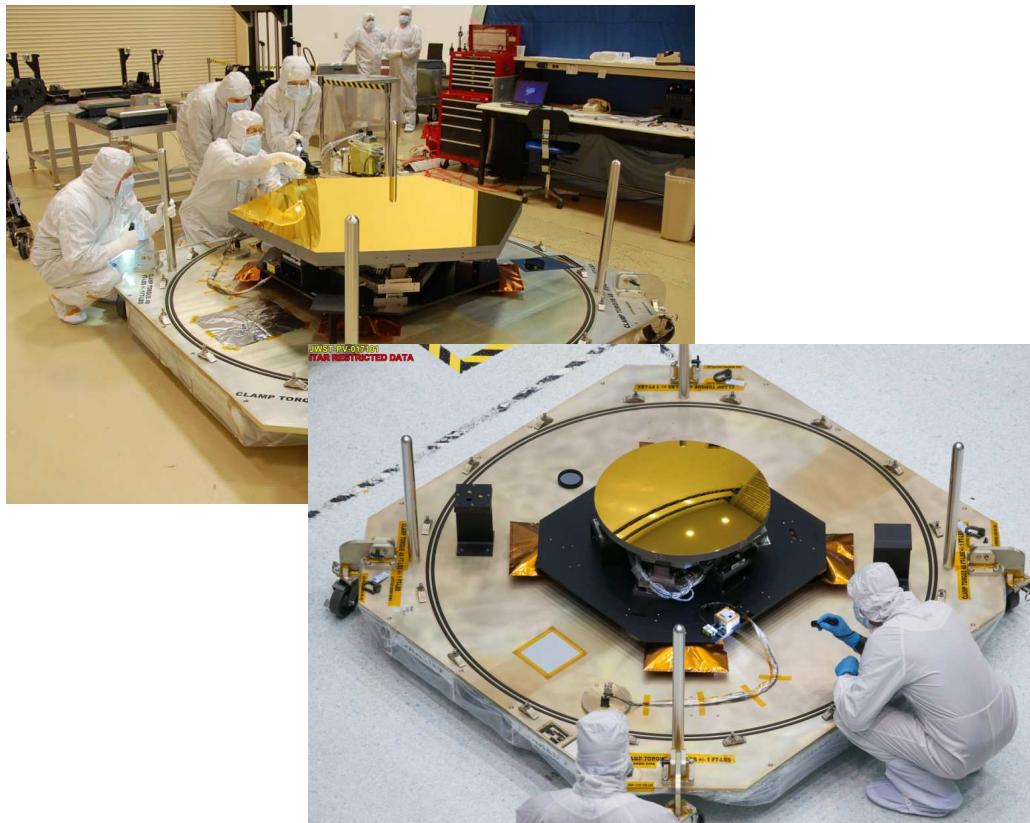

Mirror Status

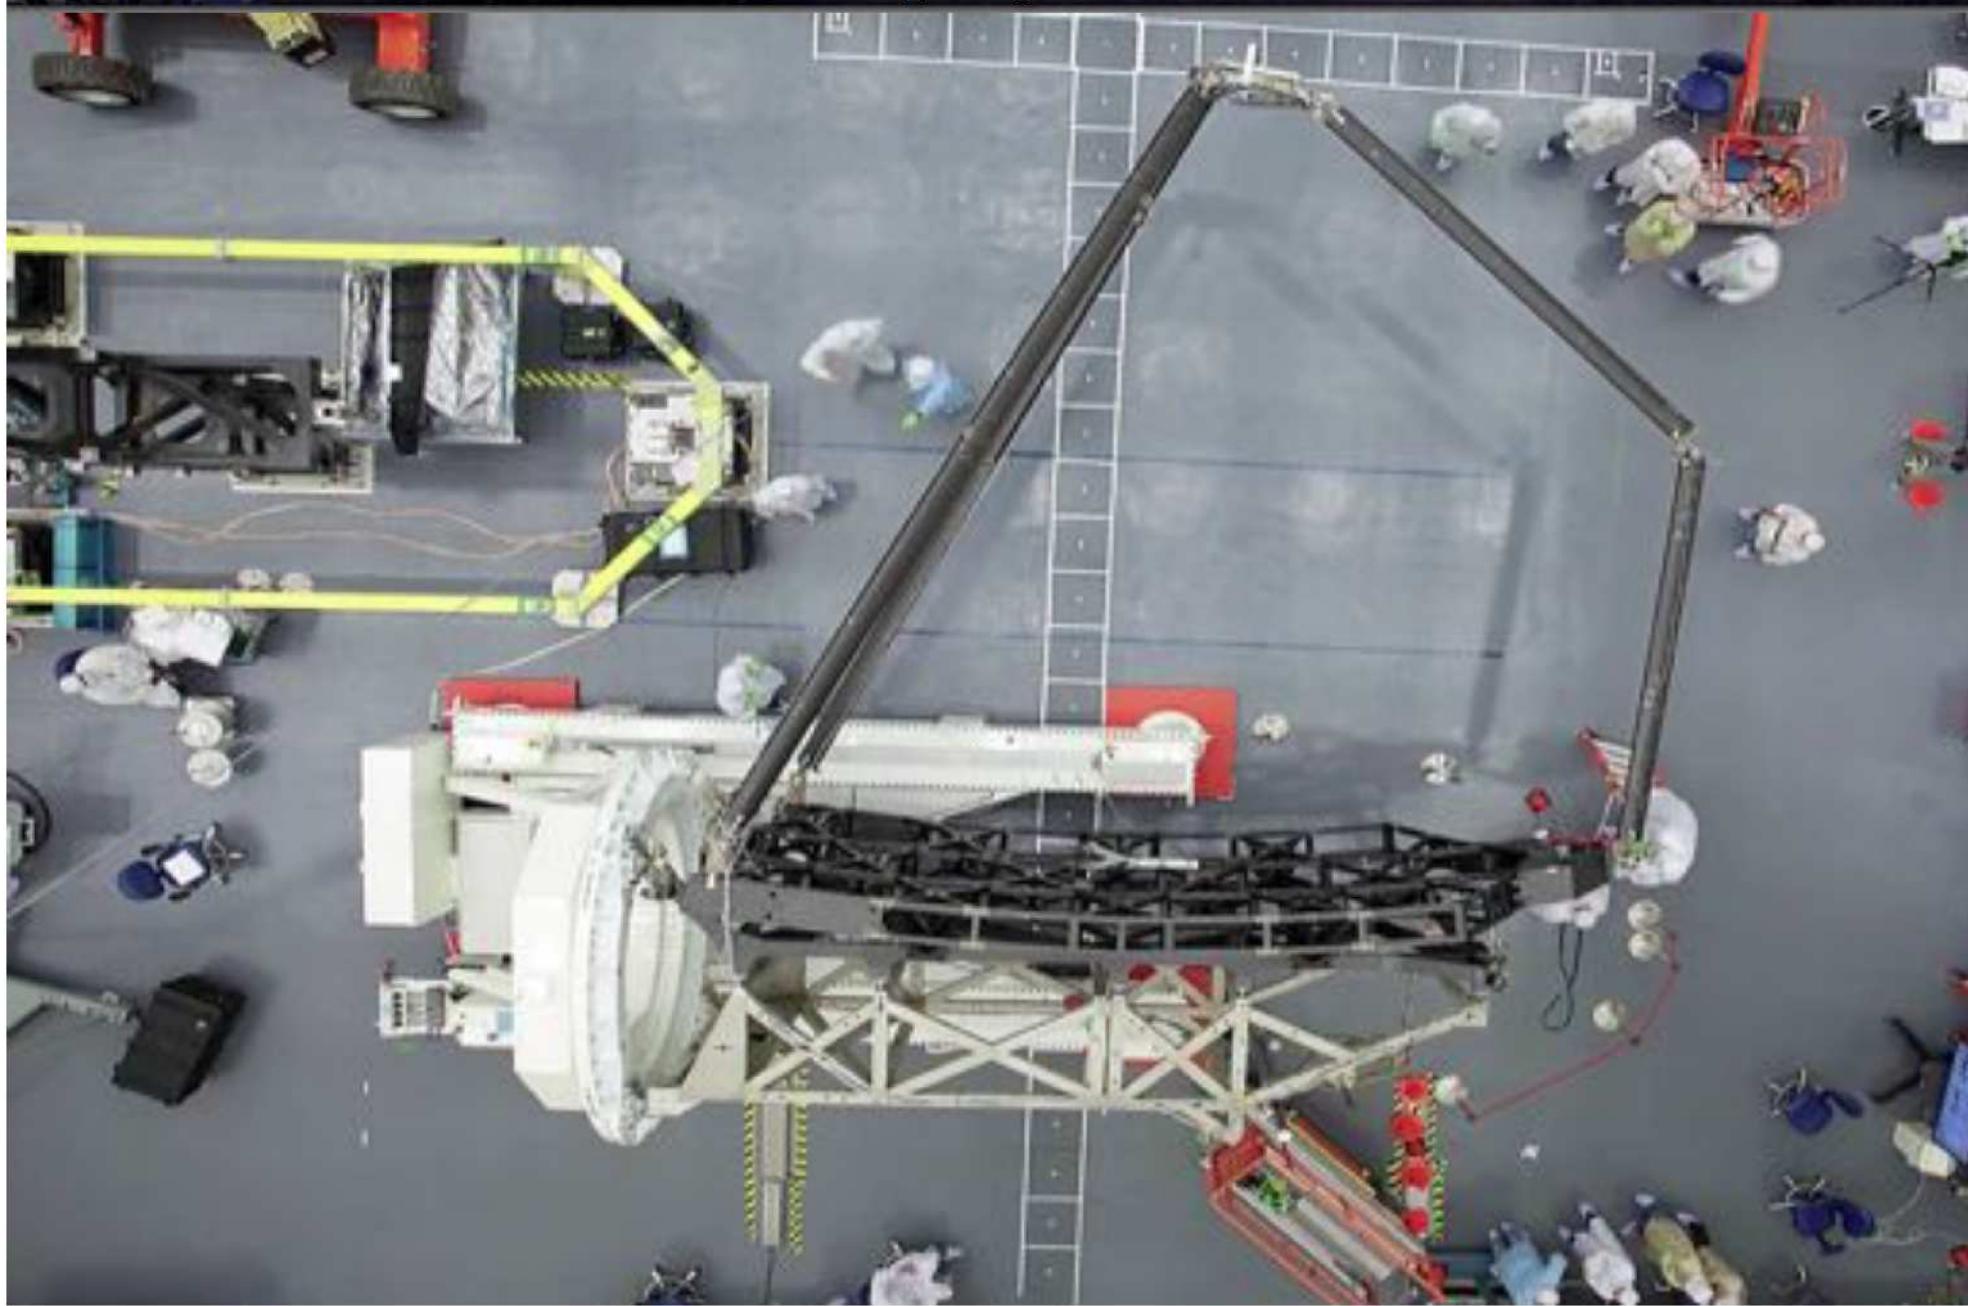

- **15 flight primary mirrors and the flight secondary mirror are at GSFC in storage**
 - All spares were at GSFC in storage (SM spares, 3 PMSA spares)
 - 2 EDU mirrors sent back to Ball for gear motor rework
 - All flight gear motor refurbishment is complete
 - All flight mirrors will be at GSFC by end of year, needed in 2015

Spring 2014: All 18 flight mirrors delivered to NASA GSFC (MD).

Pathfinder: Powered Deployment of SMSS

July 2014: Secondary Mirror Support deployment successfully tested.

Sunshield Deployment

July 2014: Engineering sunshield successfully deployed at Northrop (CA).

(1c) JWST instrument update: US (UofA, JPL), ESA, & CSA.

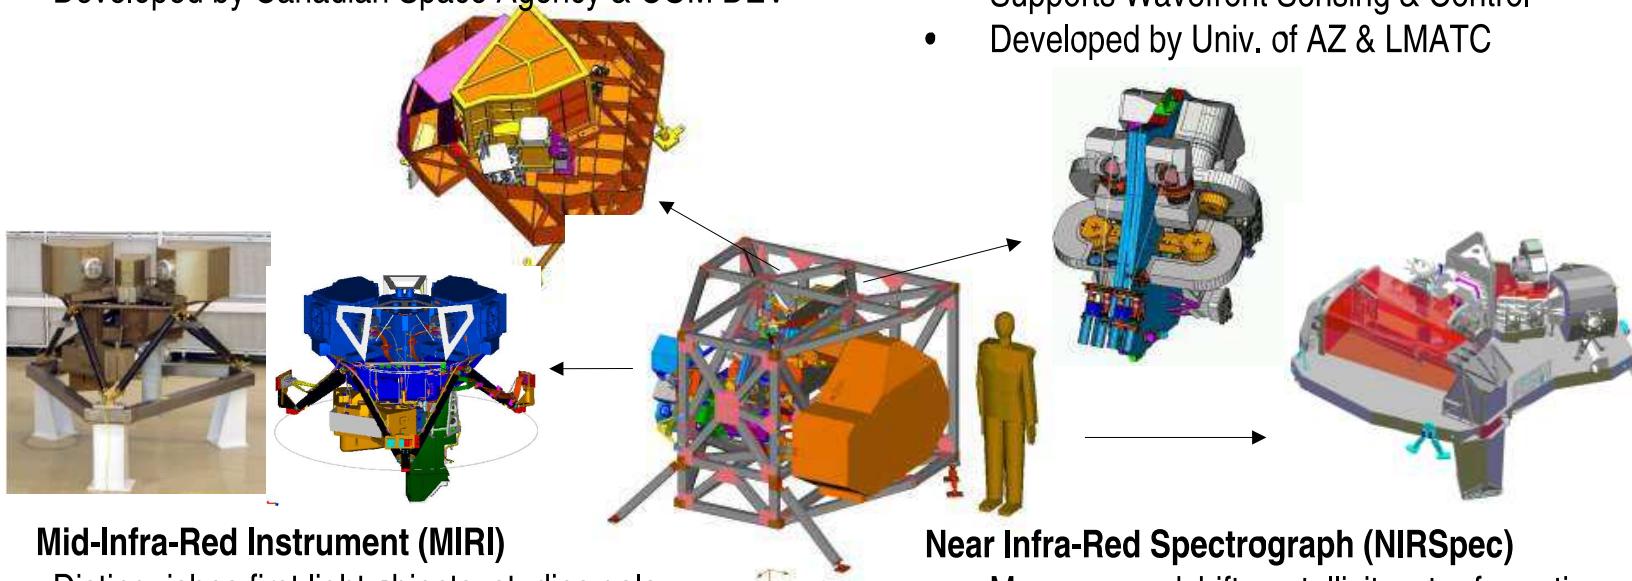

Instrument Overview

Fine Guidance Sensor (FGS)

- Ensures guide star availability with >95% probability at any point in the sky
- Includes Narrowband Imaging Tunable Filter
- Developed by Canadian Space Agency & COM DEV

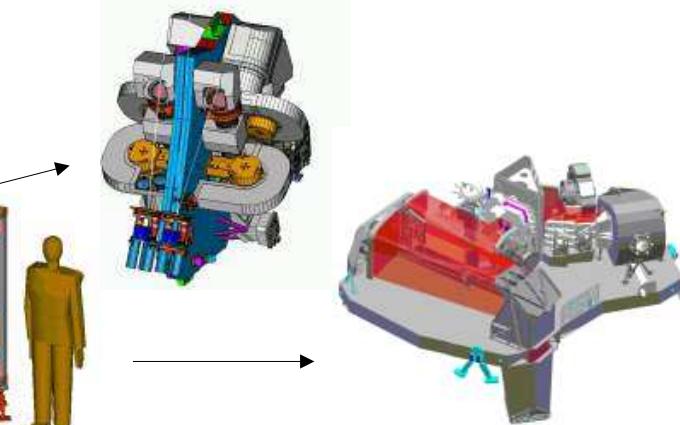

Mid-Infra-Red Instrument (MIRI)

- Distinguishes first light objects; studies galaxy evolution; explores protostars & their environs
- Imaging and spectroscopy capability
- 5 to 27 microns
- Cooled to 7K by Cyro-cooler
- Combined European Consortium/JPL development

Near Infra-Red Camera (NIRCam)

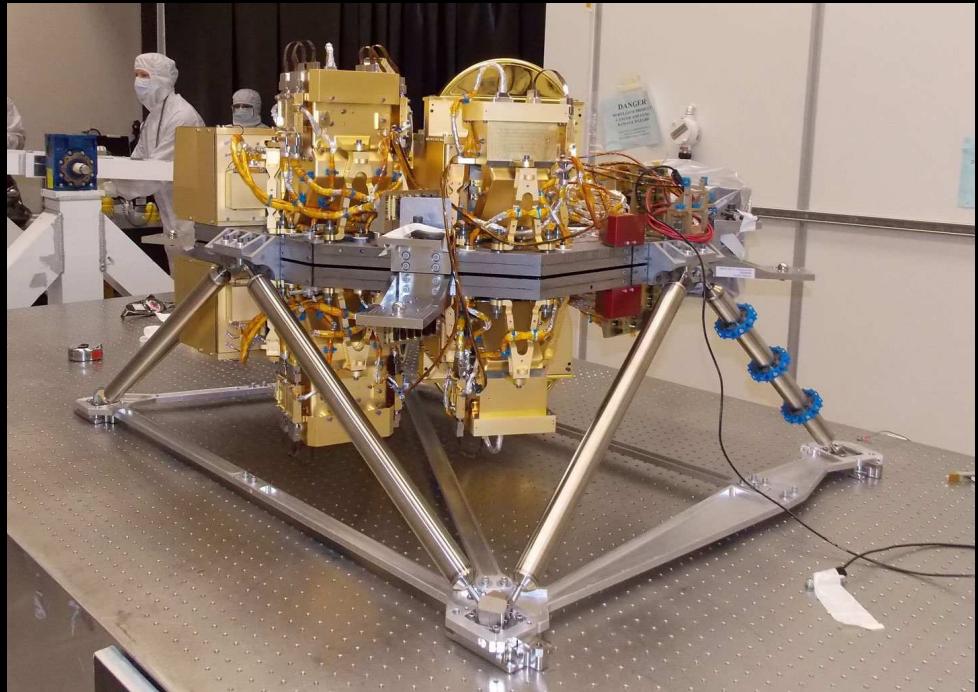

- Detects first light galaxies and observes galaxy assembly sequence
- 0.6 to 5 microns
- Supports Wavefront Sensing & Control
- Developed by Univ. of AZ & LMATC

Near Infra-Red Spectrograph (NIRSpec)

- Measures redshift, metallicity, star formation rate in first light galaxies
- 0.6 to 5 microns
- Simultaneous spectra of >100 objects
- Developed by ESA & EADS with NASA/GSFC Detector & Microshutter Subsystems

All delivered: MIRI 05/12; FGS 07/12; NIRCam 07/13, NIRSpec 9/13.

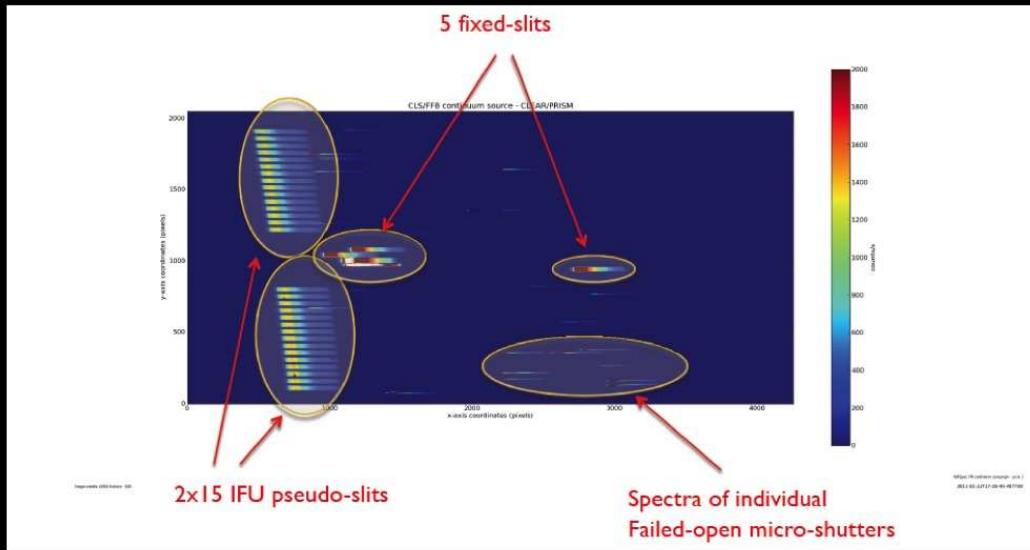

JWST's short-wavelength ($0.6\text{--}5.0\mu\text{m}$) imagers:

- NIRCam — built by UofA (AZ) and Lockheed (CA).
- Fine Guidance Sensor (& $1\text{--}5\mu\text{m}$ grisms) — built by CSA (Montreal).
- FGS includes very powerful low-res Near-IR grism spectrograph (NIRISS).
- FGS delivered to GSFC 07/12; NIRCam delivered July 28, 2013.

Flight NIRSpec First Light

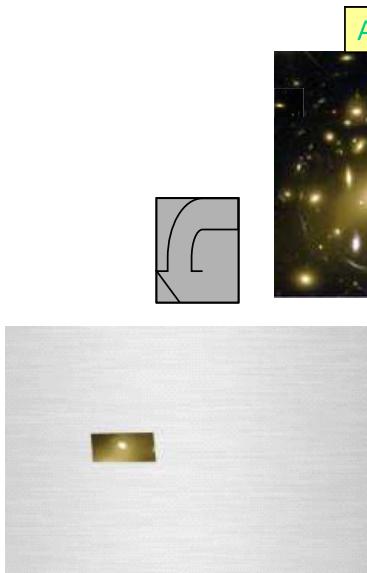

JWST's short-wavelength ($0.6\text{--}5.0\mu\text{m}$) spectrograph:

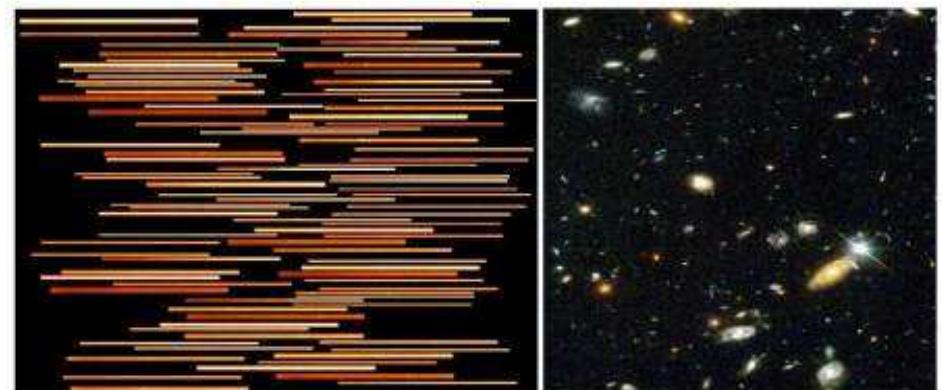

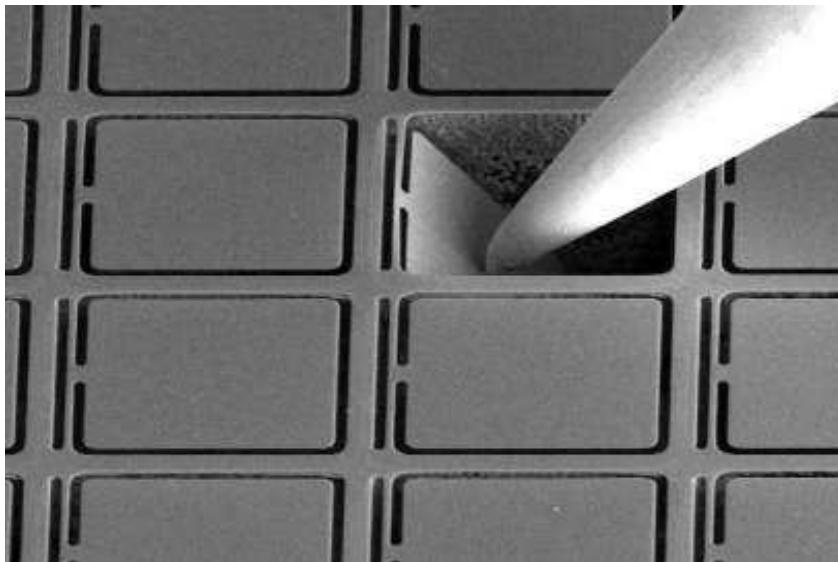

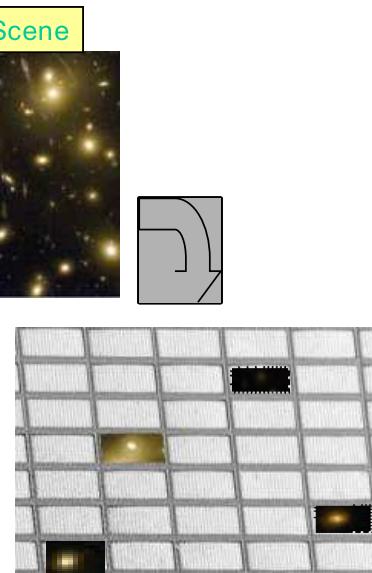

- NIRSpec — built by ESA/ESTEC and Astrium (Munich).
- Flight build completed and tested with First Light in Spring 2011.

NIRSpec delivered to NASA/GSFC in Sept. 2013.

Micro Shutters

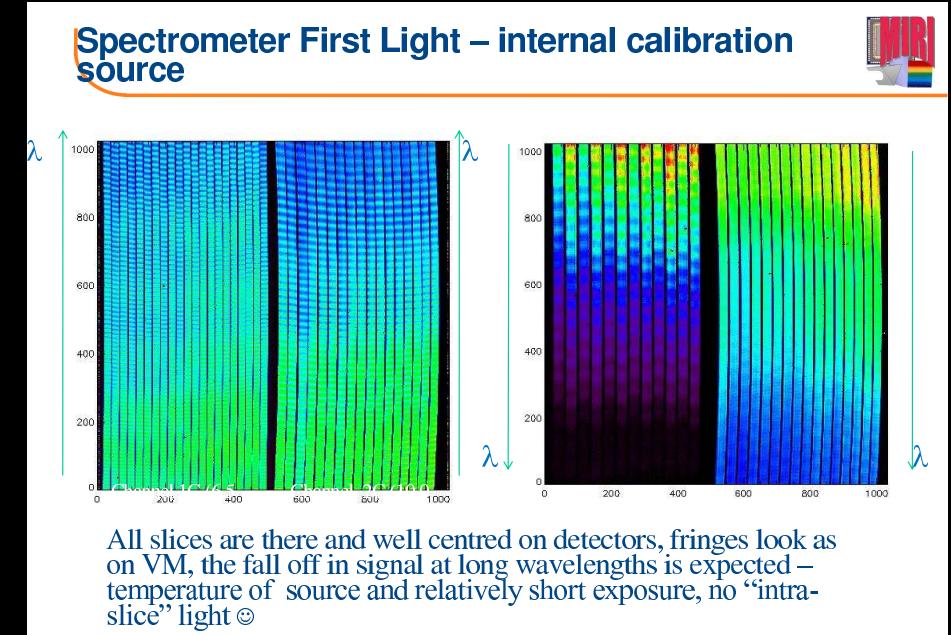

Metal Mask/Fixed Slit

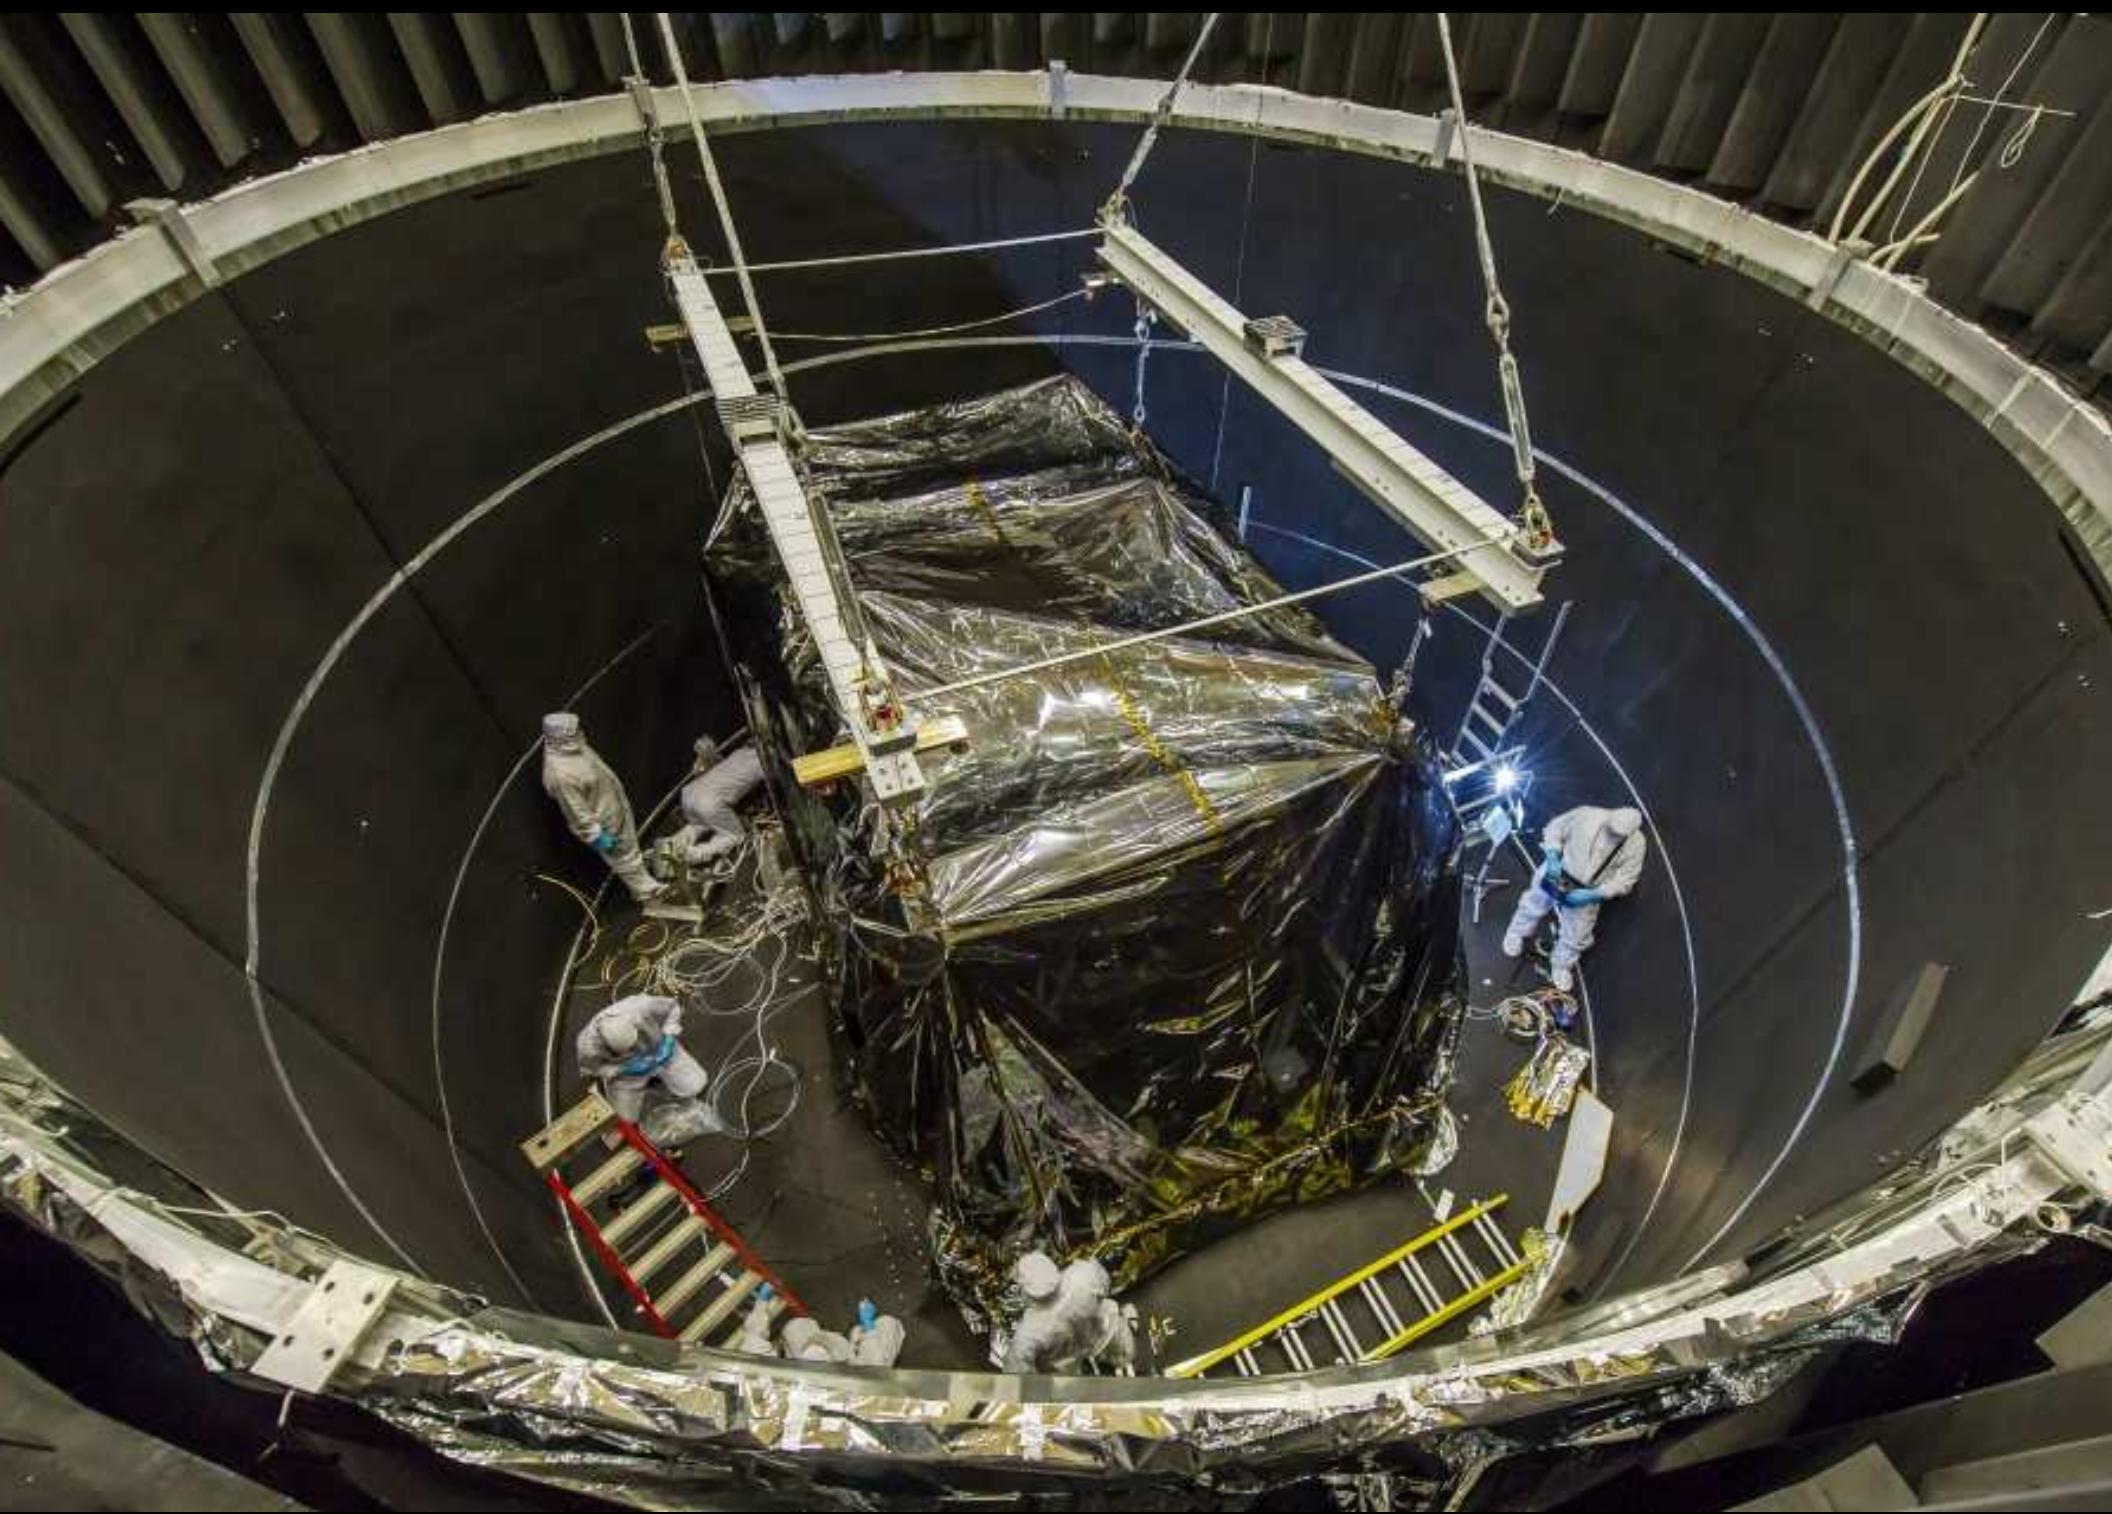

Flight MIRI

JWST's mid-infrared ($5\text{--}29\mu\text{m}$) camera and spectrograph:

- MIRI — built by ESA consortium of 10 ESA countries & NASA JPL.
- Flight build completed and tested with First Light in July 2011.

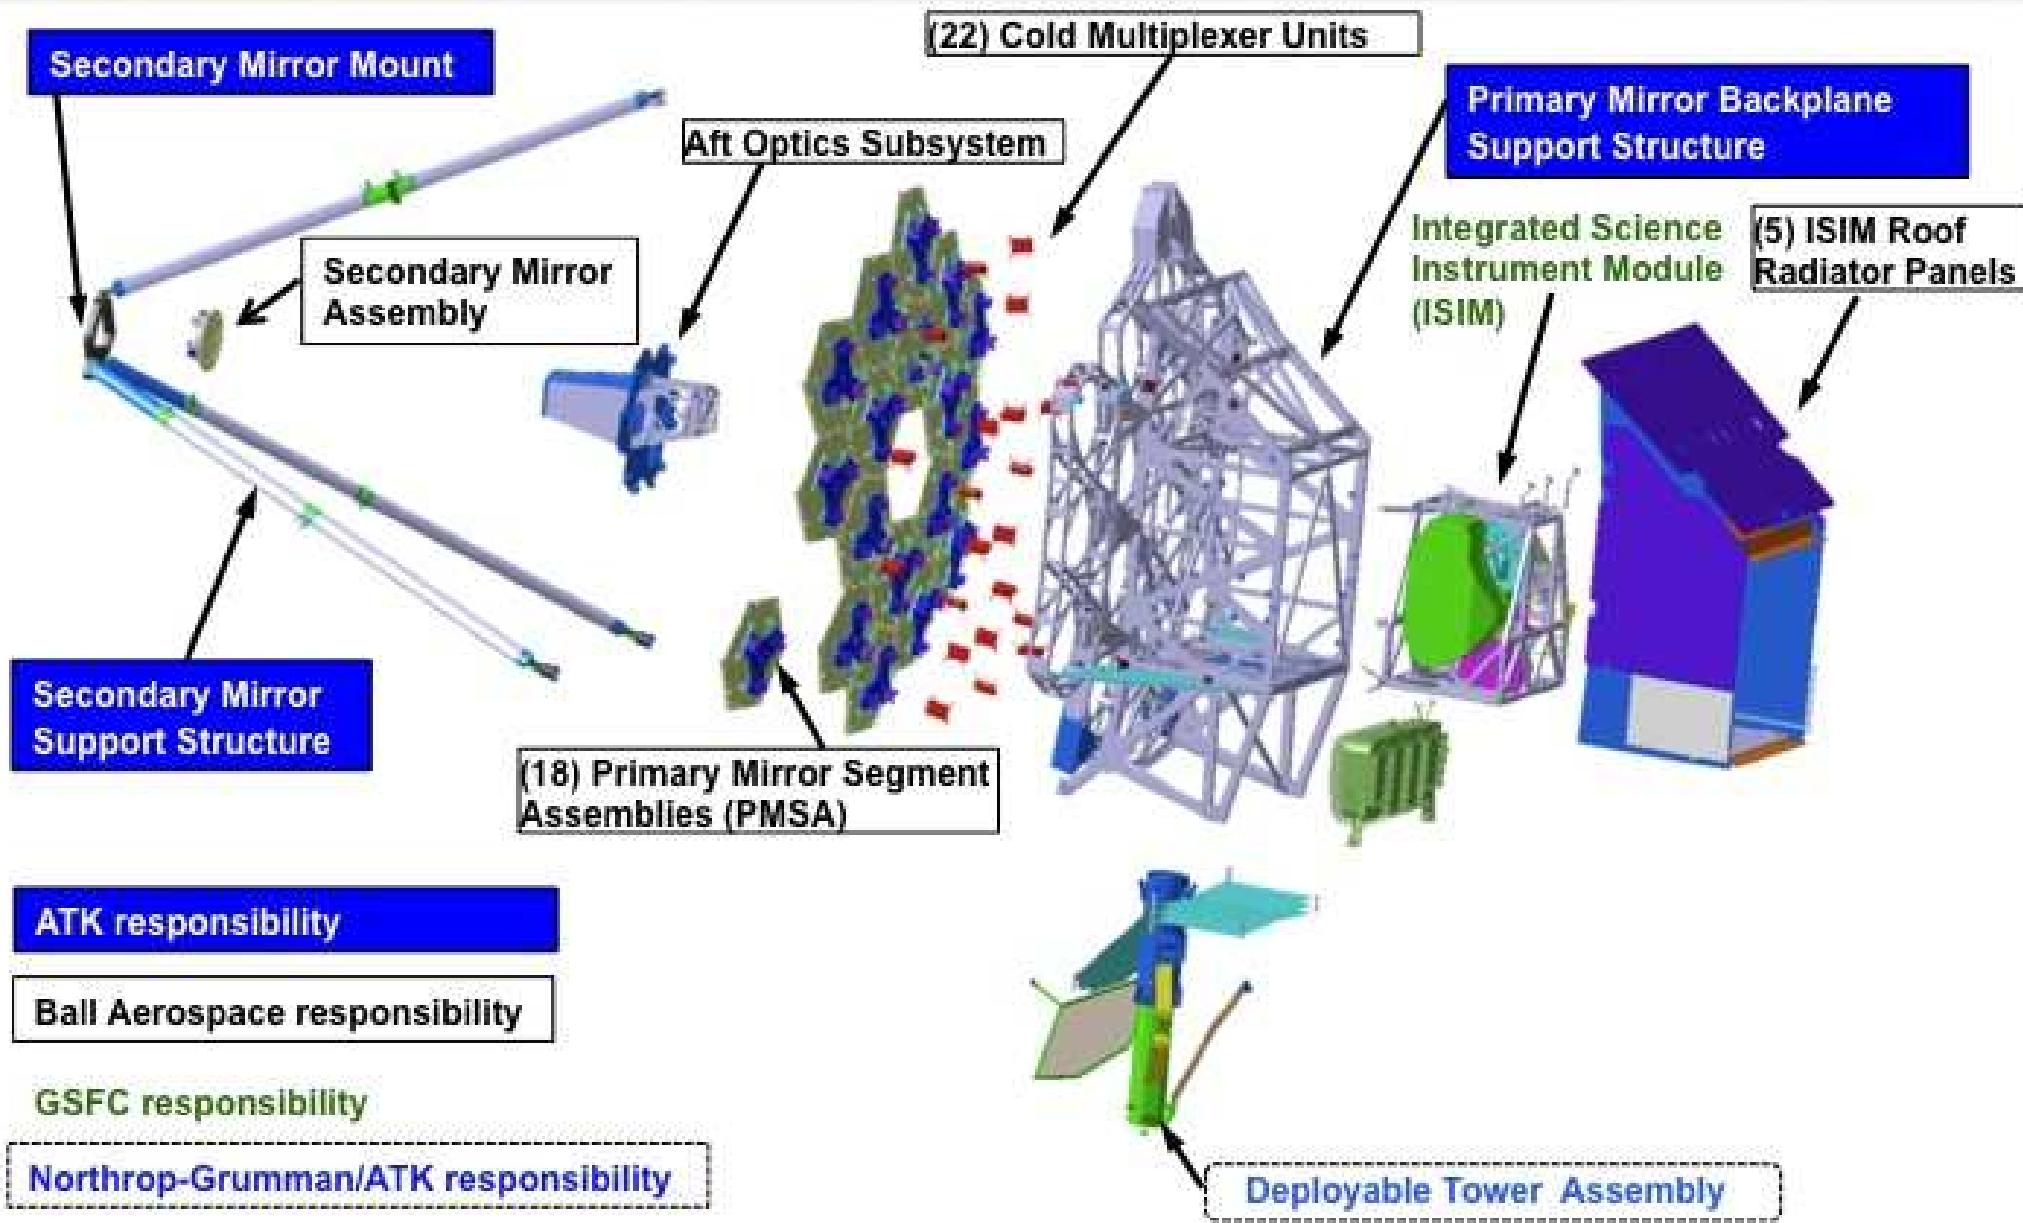

MIRI delivered to NASA/GSFC in May 2012.

June 2014: Actual Flight ISIM (with all 4 instruments) lowered into OSIM.

TELESCOPE ARCHITECTURE

3/31/11

2014–2016: Complete system integration at GSFC and Northrop.

OTIS Test GSE Architecture and Subsystems

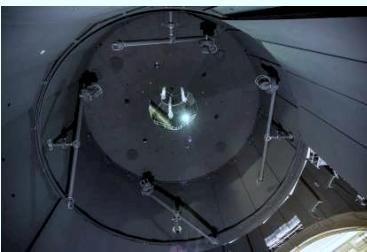

Chamber Isolator Units

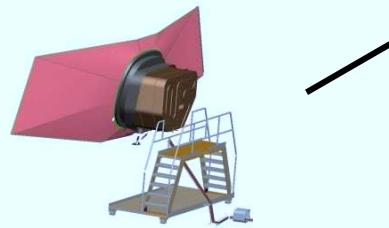

Dynamically isolates OTIS Optical Test
– Integration 6 units complete

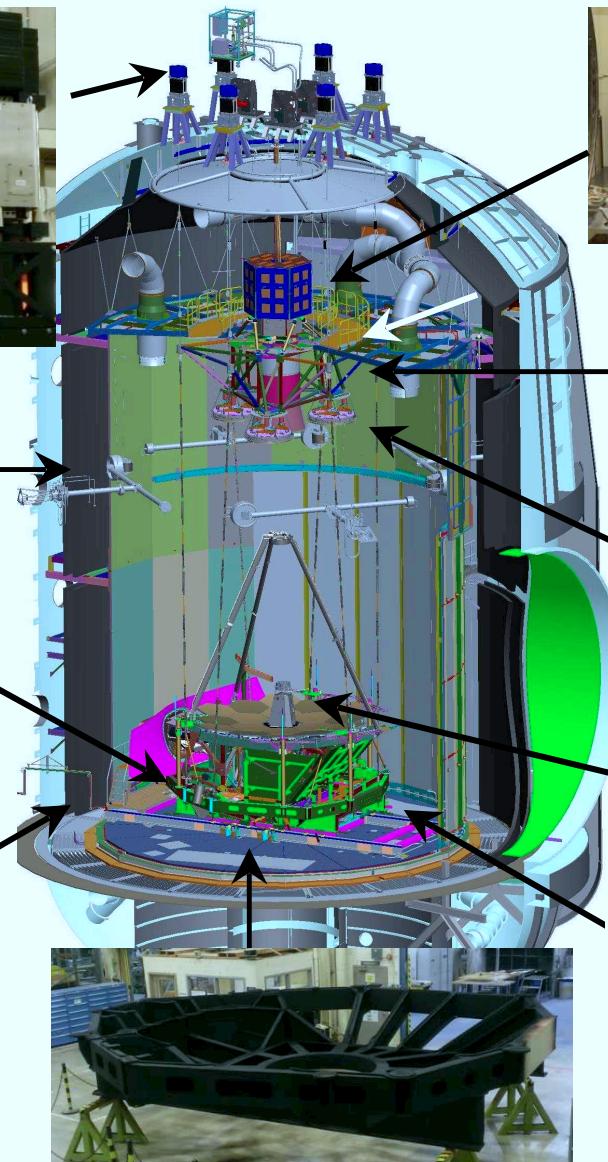

Cryo Position Metrology (CPM)
Photogrammetry System
Integration Complete

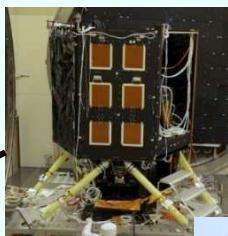

ADM - new Leica
delivered and under
test

Space Vehicle Thermal Simulator
(SVTS)
and Sunshield Simulator
Passed design review and started
Procurements and fab subcontracts

HOSS – OTIS support structure
HOSS – will be in the chamber for Bake out in June

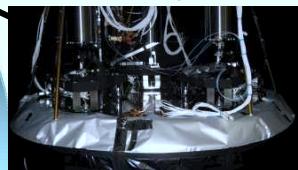

Center of Curvature Optical Assembly (COCOA)

- Multiwavelength interferometer (MWIF), null, calibration equipment, coarse/fine PM phasing tools, Displacement Measuring Interferometer – COCOA was exercised at MSFC in December

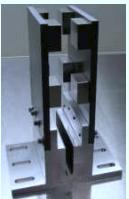

USF Structural Frame – supports Metrology
ready for chamber integration and Cryo Load tests

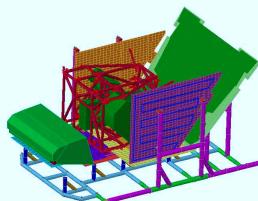

AOS Source Plate
1.5 M Plano for Pass and Half Testing
Cryo testing underway, ACF 1 complete, ACF 4 in
Cryo test complete , ACF 5 ready for Cryo.

AOS Source Plate
Sources for Pass and Half Test
72 optical fiber support cont.

Mag Damper Cryo
Test Article
Fabrication started

Deep Space Edge Radiation Sink (DSERS)

Thermal modeling of payload and DSERS
started

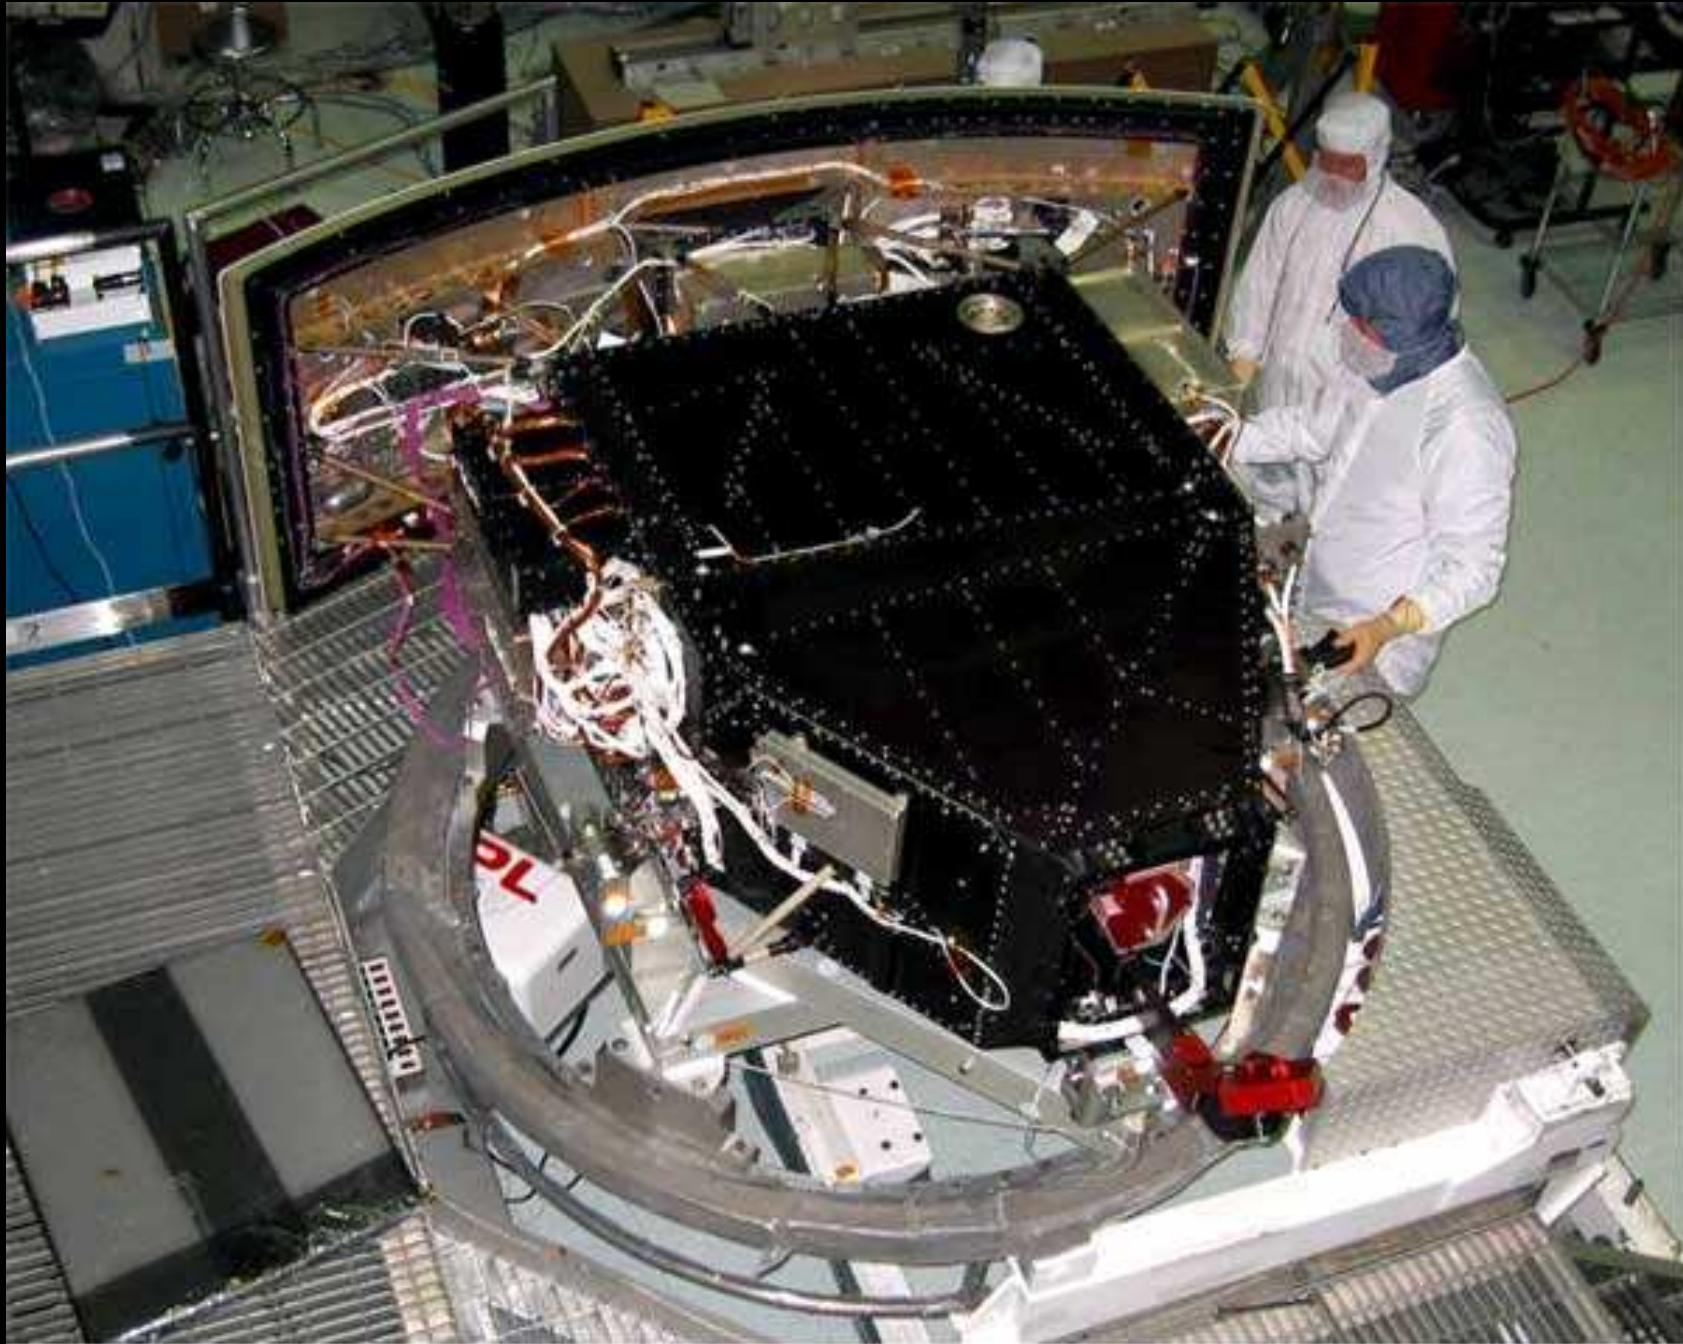

World's largest TV chamber OTIS: will test whole JWST in 2016–2017.

(2) HST WFC3: Measuring Galaxy Assembly and SMBH/AGN Growth?

10 filters with HST/WFC3 & ACS reaching AB=26.5–27.0 mag (10- σ) over 40 arcmin² at 0.07–0.15" FWHM from 0.2–1.7 μ m (UVUBVizYJH). JWST adds 0.05–0.2" FWHM imaging to AB \simeq 31.5 mag (1 nJy) at 1–5 μ m, and 0.2–1.2" FWHM at 5–29 μ m, tracing young+old SEDs & dust.

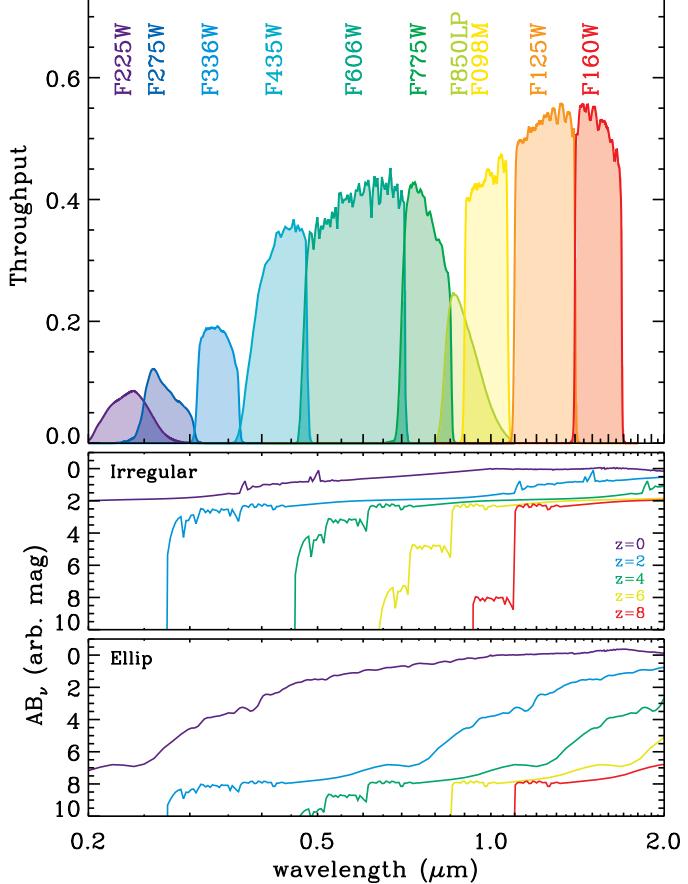

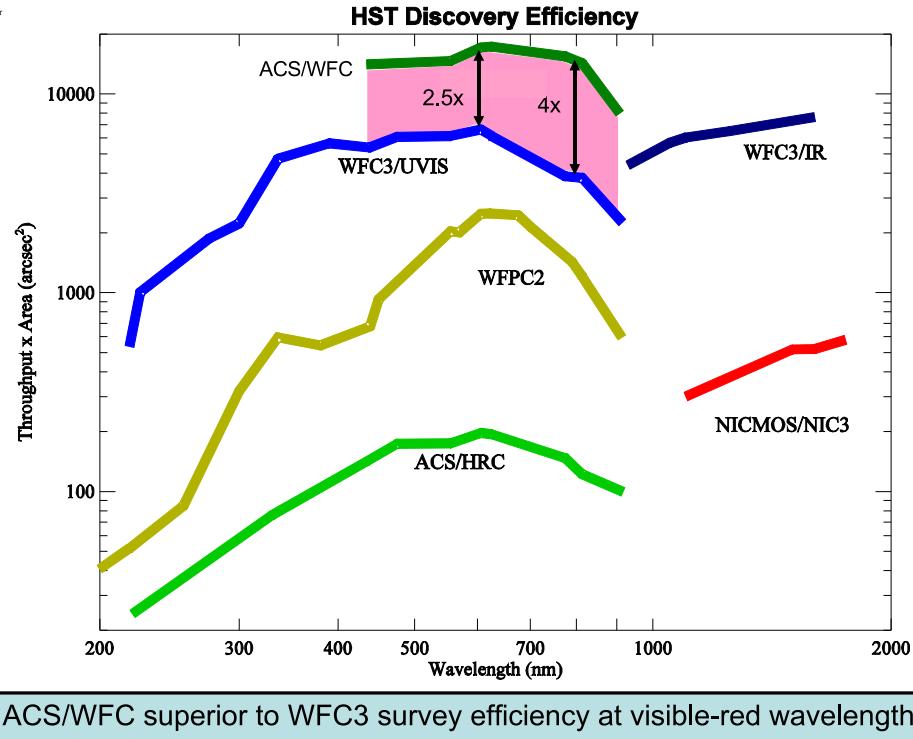

(2a) WFC3: Hubble's new Panchromatic High-Throughput Camera

HST WFC3 and its IR channel: a critical pathfinder for JWST science.

Role of ACS in HST Post-SM4 Imaging Capability

WFC3/UVIS channel unprecedented UV–blue throughput & areal coverage:

- QE $\gtrsim 70\%$, $4\text{k} \times 4\text{k}$ array of $0\farcs04$ pixel, FOV $\simeq 2\farcs67 \times 2\farcs67$.

WFC3/IR channel unprecedented near-IR throughput & areal coverage:

- QE $\gtrsim 70\%$, $1\text{k} \times 1\text{k}$ array of $0\farcs13$ pixel, FOV $\simeq 2\farcs25 \times 2\farcs25$.

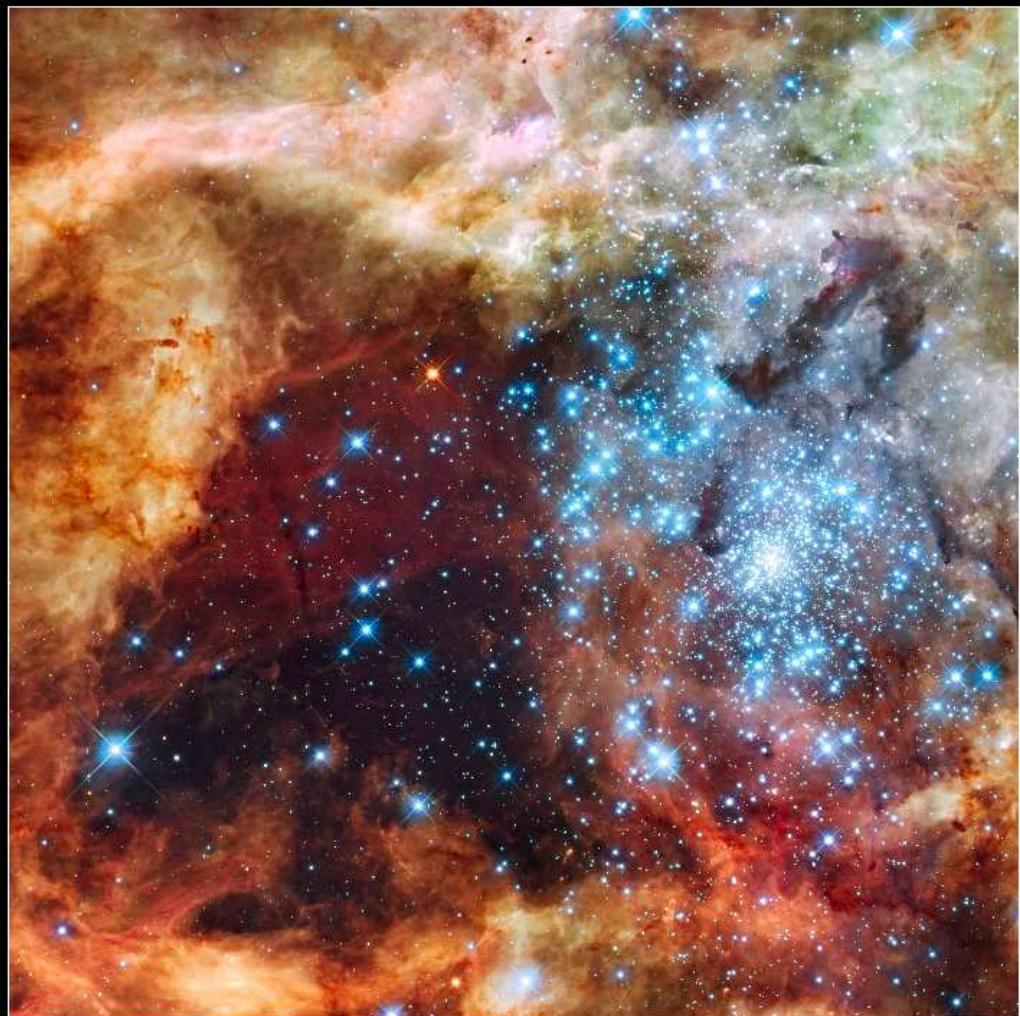

\Rightarrow WFC3 opened major new parameter space for astrophysics in 2009:

WFC3 filters designed for star-formation and galaxy assembly at $z \simeq 1\text{--}8$.

- HST WFC3 and its IR channel a critical pathfinder for JWST science.

Visible

Infrared

30 Doradus Nebula and Star Cluster

Hubble Space Telescope • WFC3/UVIS/IR

NASA, ESA, F. Paresce (INAF-IASF, Italy), and the WFC3 Science Oversight Committee

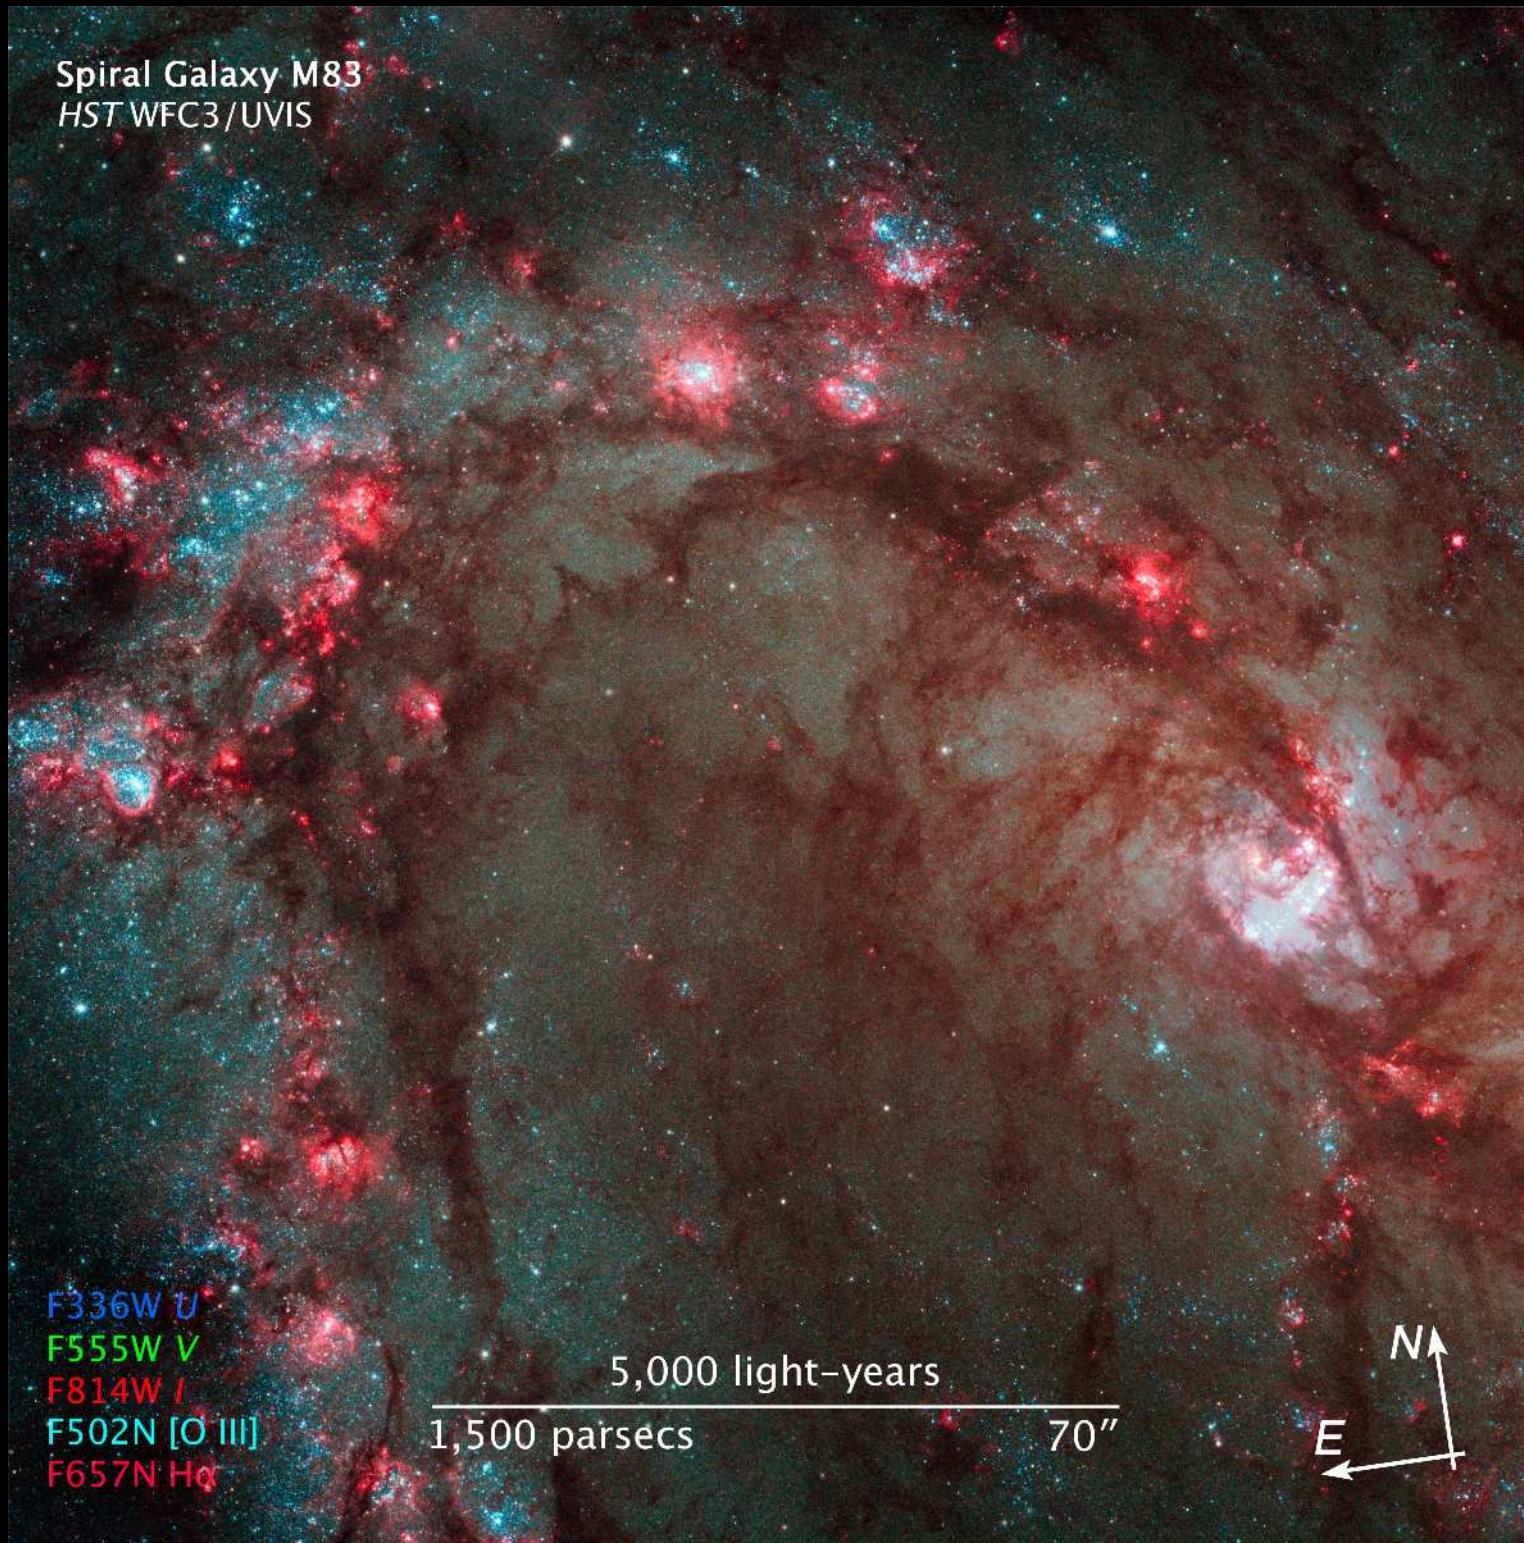

STScI-PRC09-32b

30 Doradus: Giant young star-cluster in Large Magellanic Cloud (150,000 ly), triggering birth of Sun-like stars (and surrounding debris disks).

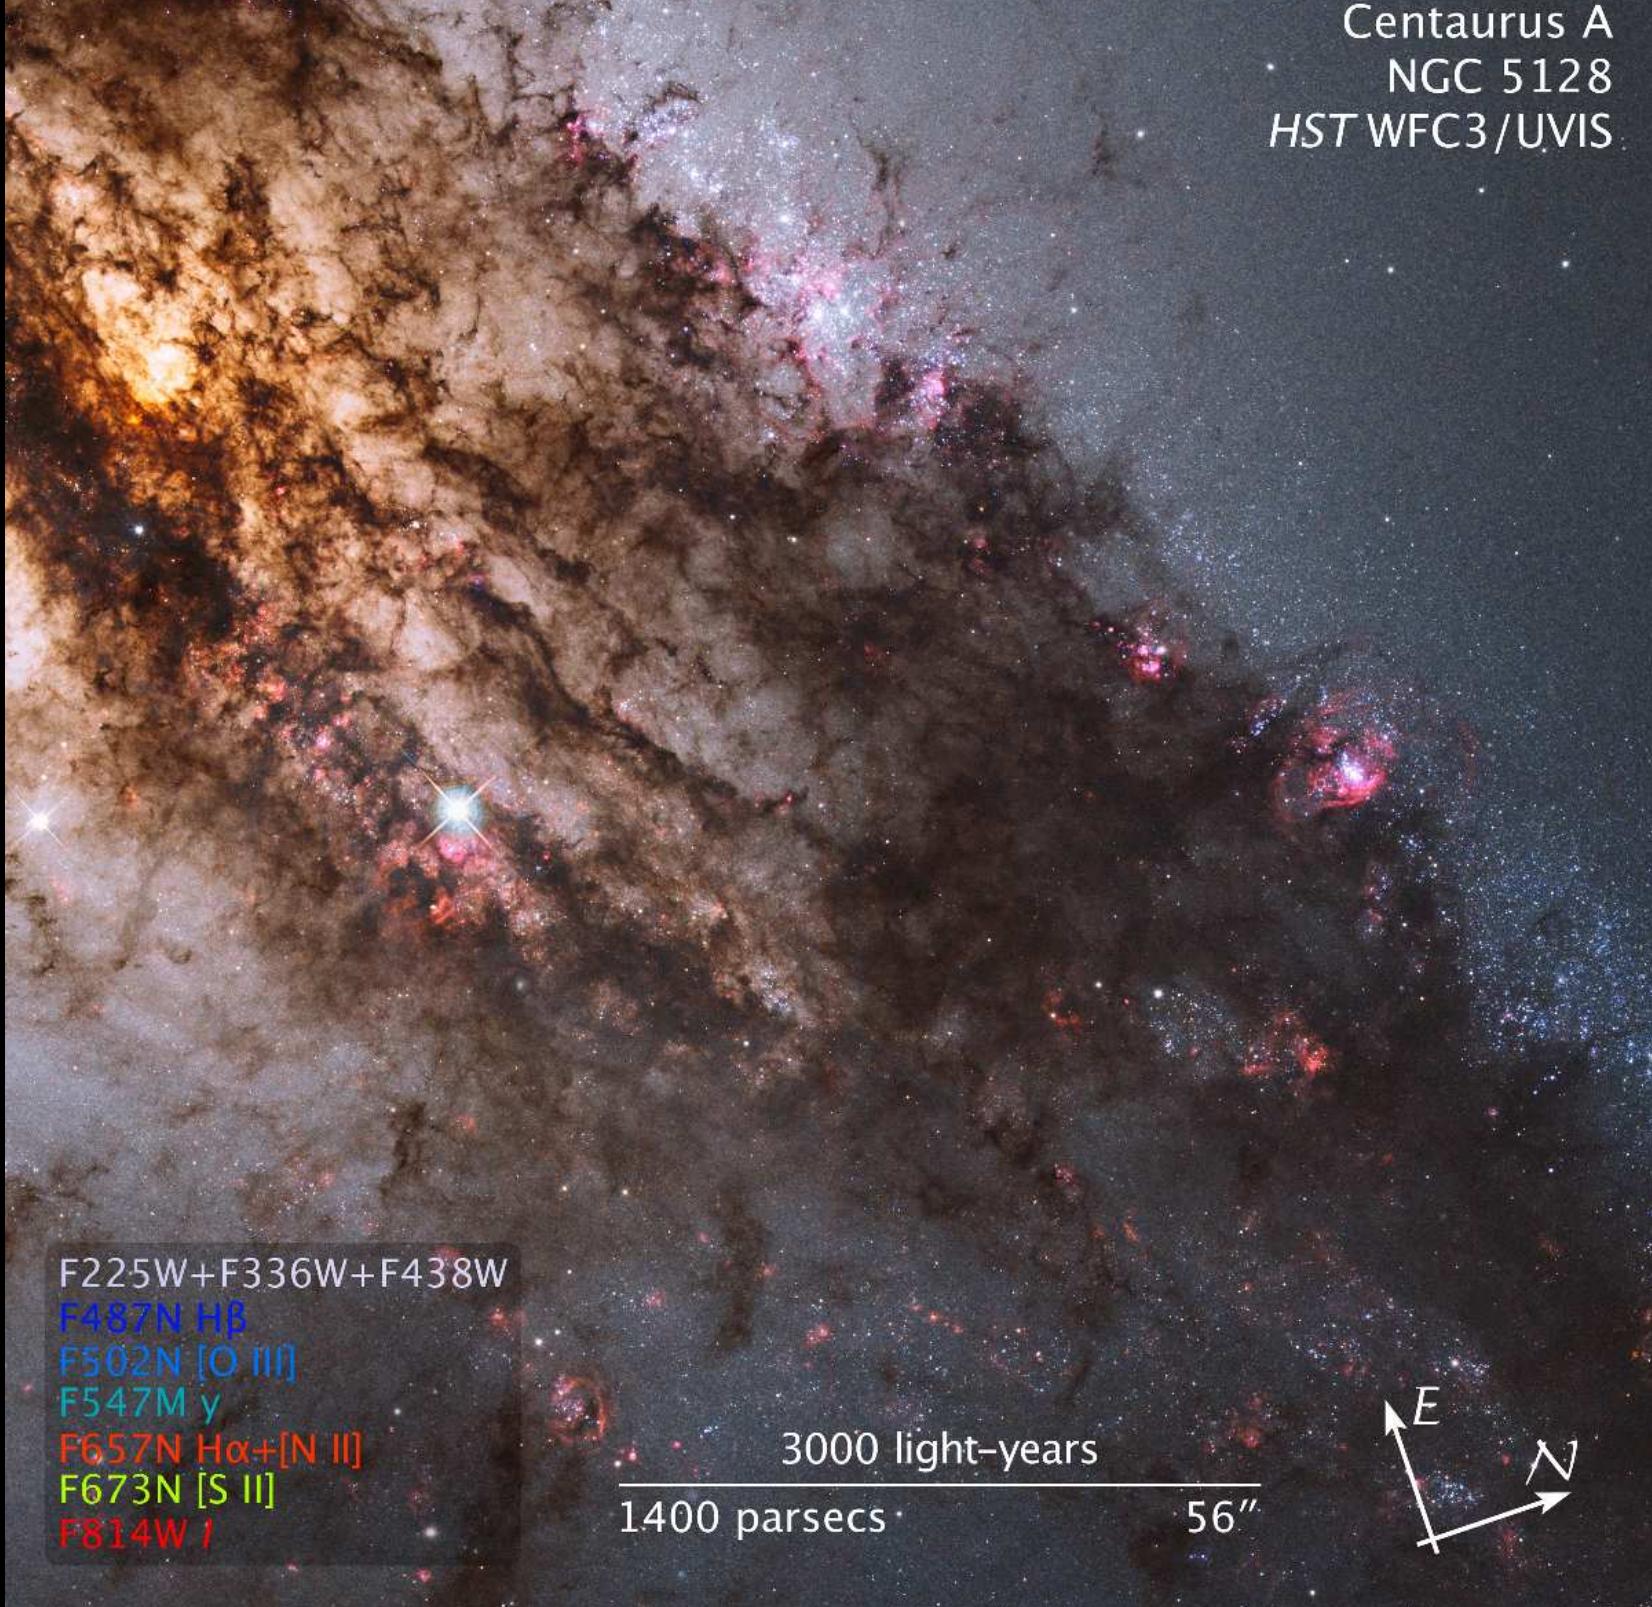

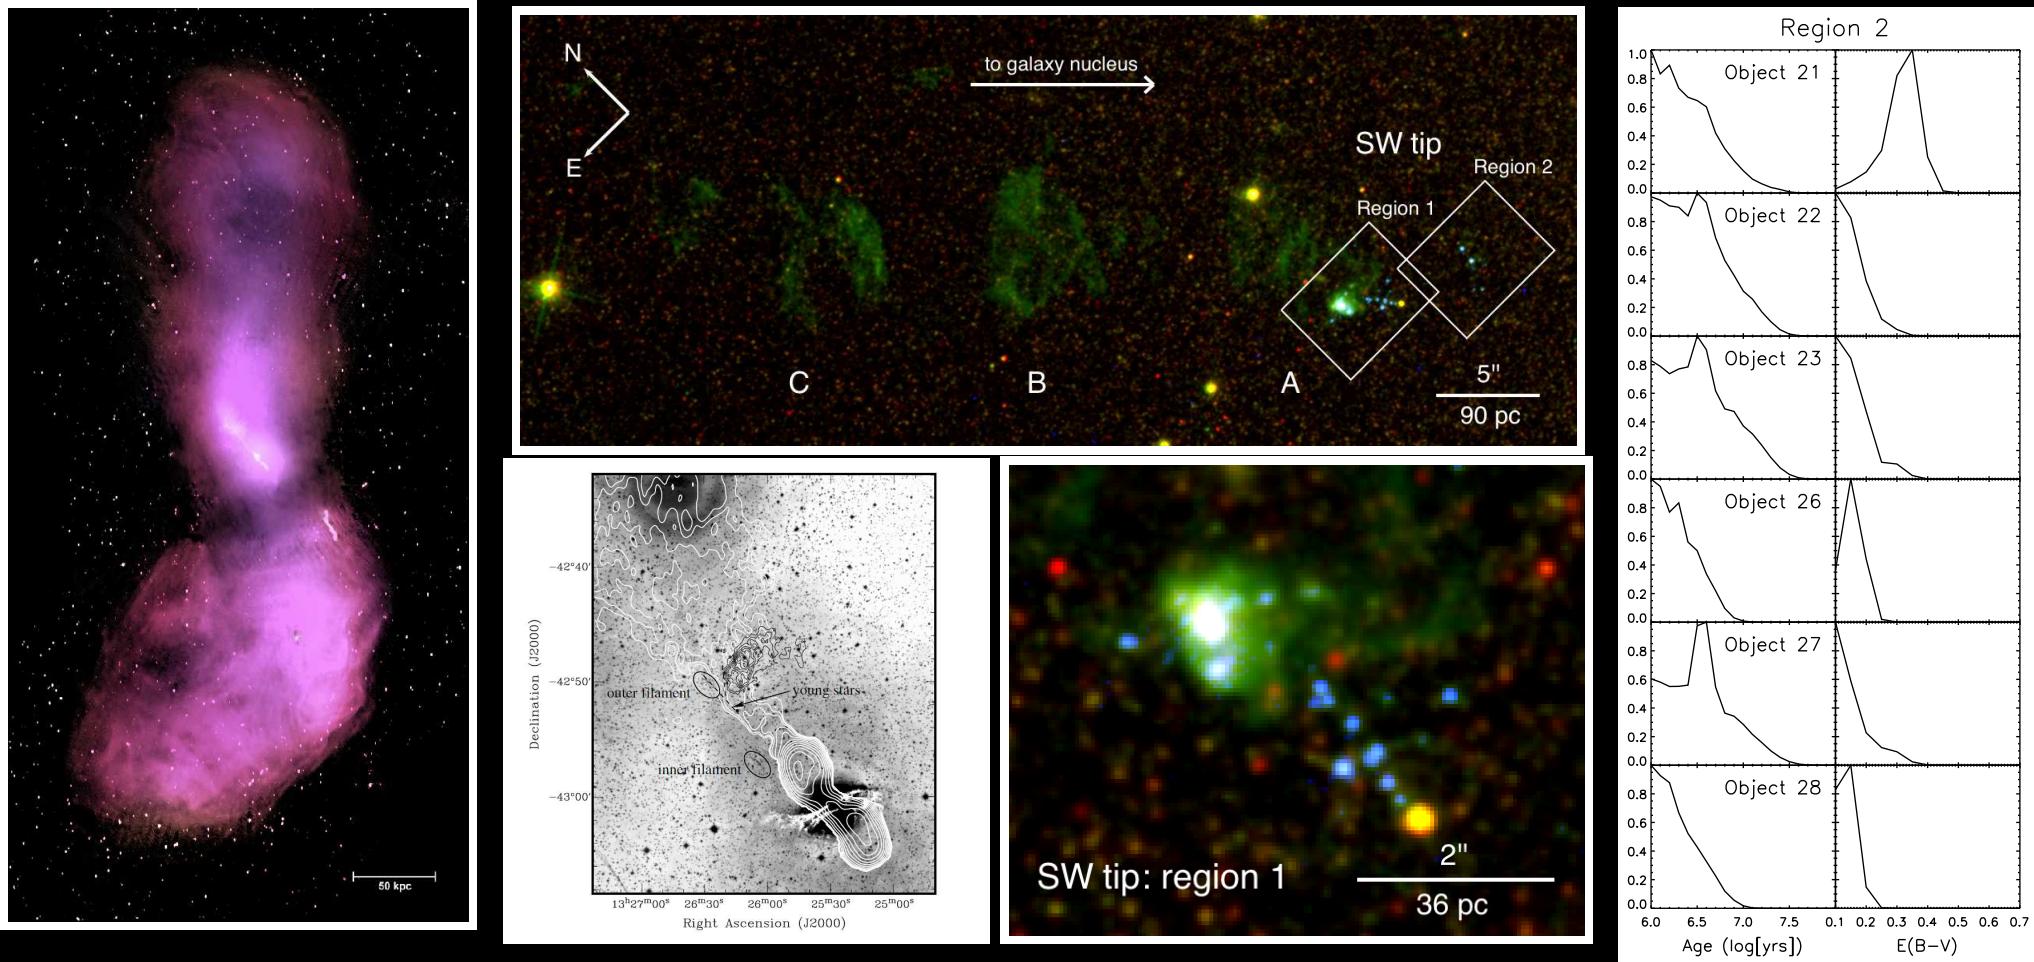

(2a) Measuring (Nearby) Galaxy Assembly and Supermassive Black-Hole Growth.

Centaurus A
NGC 5128
HST WFC3/UVIS

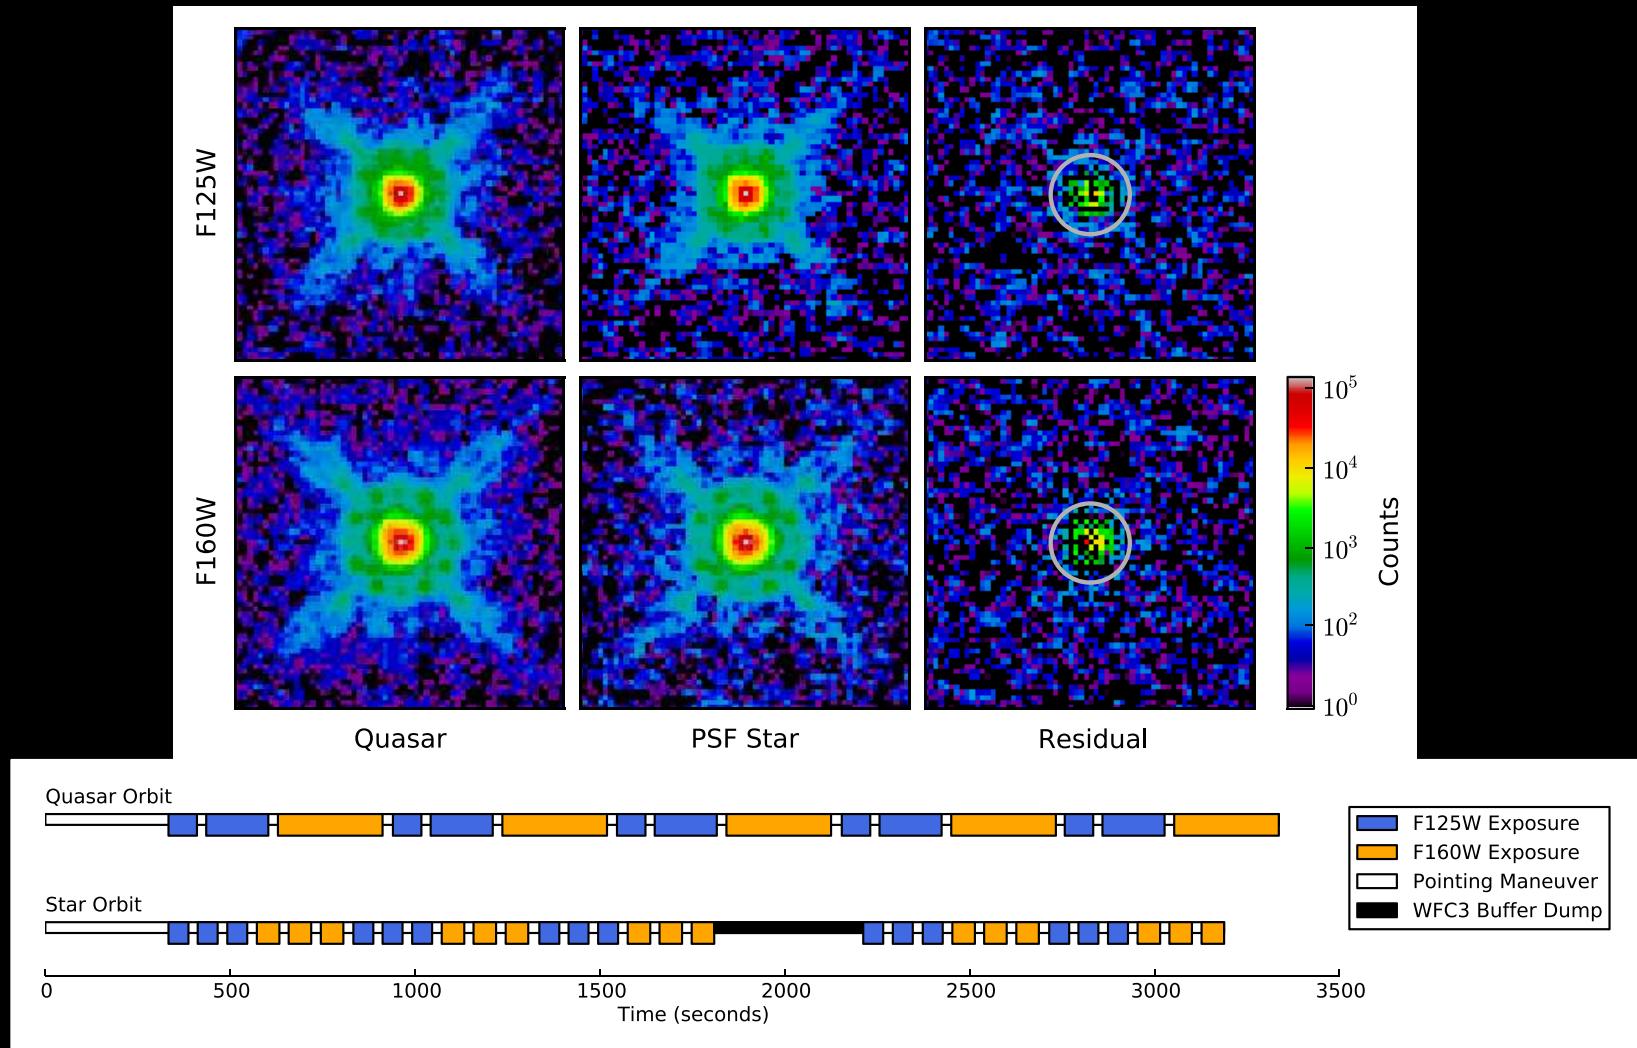

[Left] CSIRO/ATNF 1.4 GHz image of Cen A (Feain⁺ 2009).
 Fermi GeV source (Yang⁺ 12); & Auger UHE Cosmic Rays (Abreu⁺ 2010).
 [Middle] SF in Cent A jet's wake (Crockett⁺ 2012, MNRAS, 421, 1602).
 [Right] Well determined ages for young (~ 2 Myr) stars near Cen A's jet.

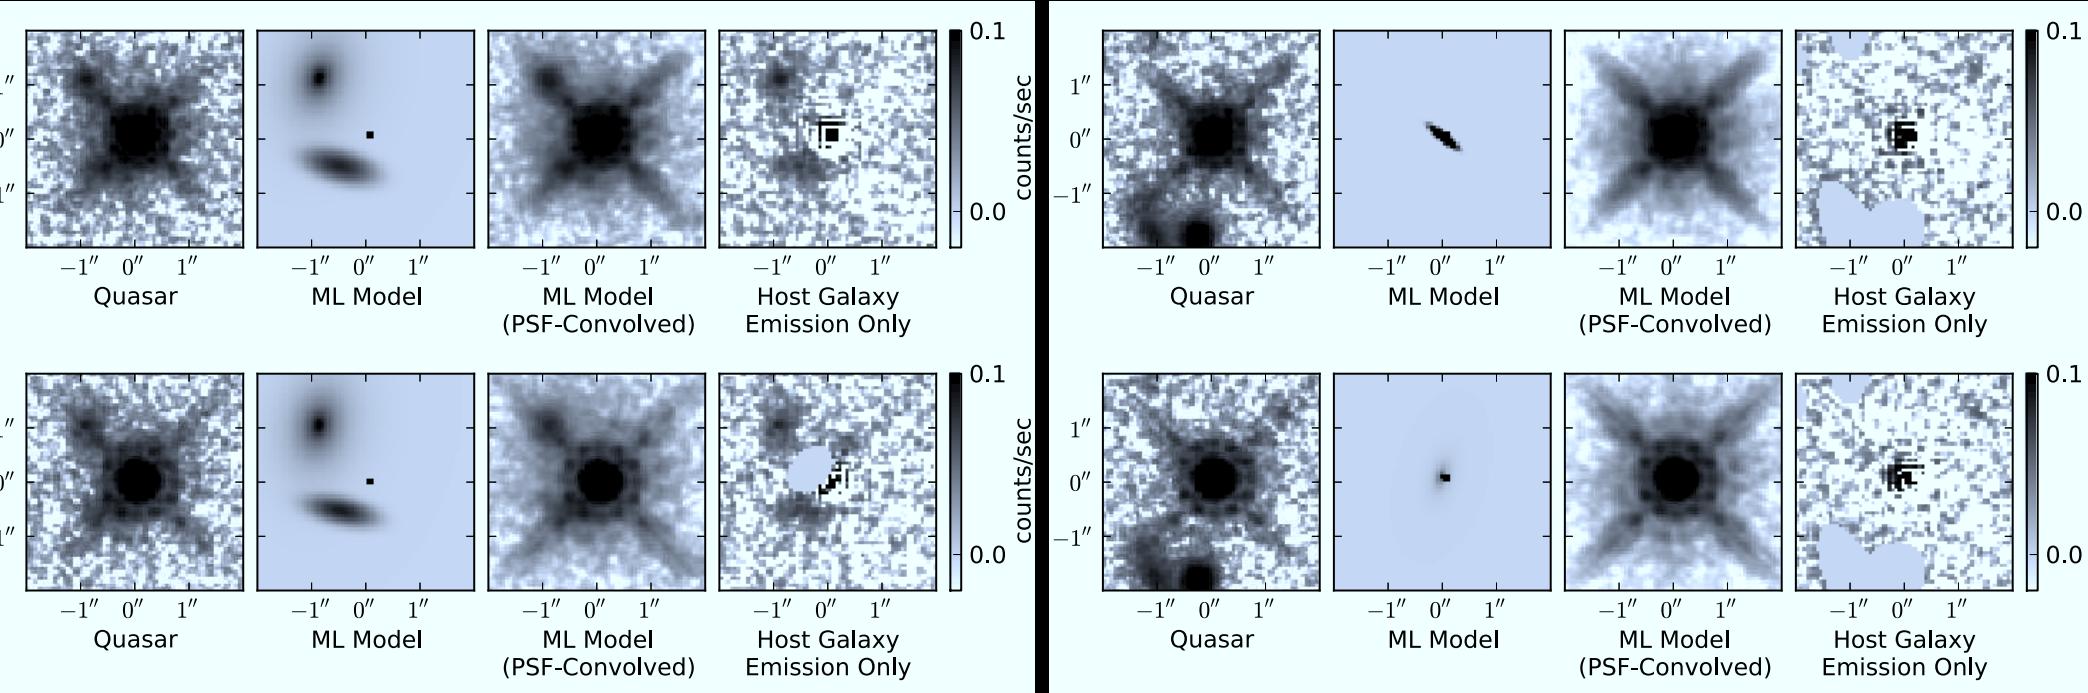

- JWST will trace older stellar pops and SF in much dustier environments.
- We must do all we can with HST in the UV–blue before JWST flies.

(2b) HST WFC3 observations of QSO host systems at $z \simeq 6$ (age $\lesssim 1$ Gyr)

- Careful contemporaneous orbital PSF-star subtraction: Removes most of “OTA spacecraft breathing” effects (Mechtley ea 2012, ApJL, 756, L38).
- PSF-star ($AB \simeq 15$ mag) subtracts $z=6.42$ QSO ($AB \simeq 18.5$) nearly to the noise limit: NO host galaxy detected $100 \times$ fainter ($AB \gtrsim 23.5$ at $r \gtrsim 0\farcs3$).

(2b) WFC3: Detection of one QSO Host System at $z \simeq 6$ (Giant merger?)

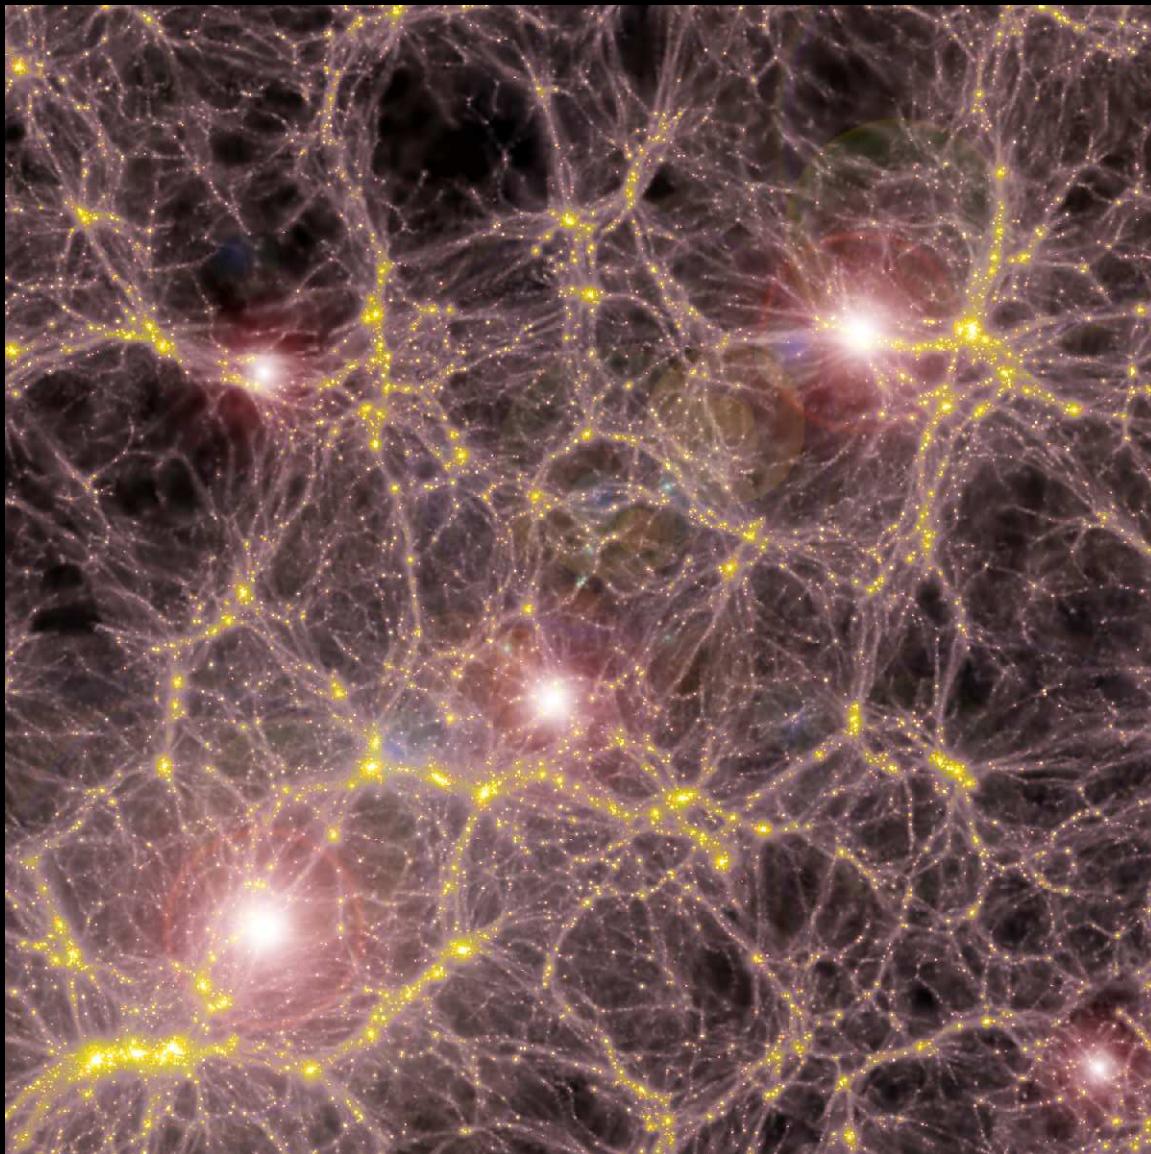

- Monte Carlo Markov-Chain of observed PSF-star + Sersic ML light-profile. Gemini AO images to pre-select PSF stars (Mechtley⁺ 2014).
- First detection out of four $z \simeq 6$ QSOs [2 more to be observed].
- One $z \simeq 6$ QSO host galaxy: Giant merger morphology + tidal structure??
- Same J+H structure! Blue UV-SED colors: $(J-H) \simeq 0.19$, constrains dust.
- $M_{AB}^{host}(z \simeq 6) \lesssim -23.0$ mag, i.e., ~ 2 mag brighter than $L^*(z \simeq 6)$!

$\Rightarrow z \simeq 6$ QSO duty cycle $\lesssim 10^{-2}$ ($\lesssim 10$ Myrs); 1/4 QSO's close to Magorrian.

G. Williger & L. Haberzettl [U-Louisville] found many such quasars at $z \simeq 2-3$.

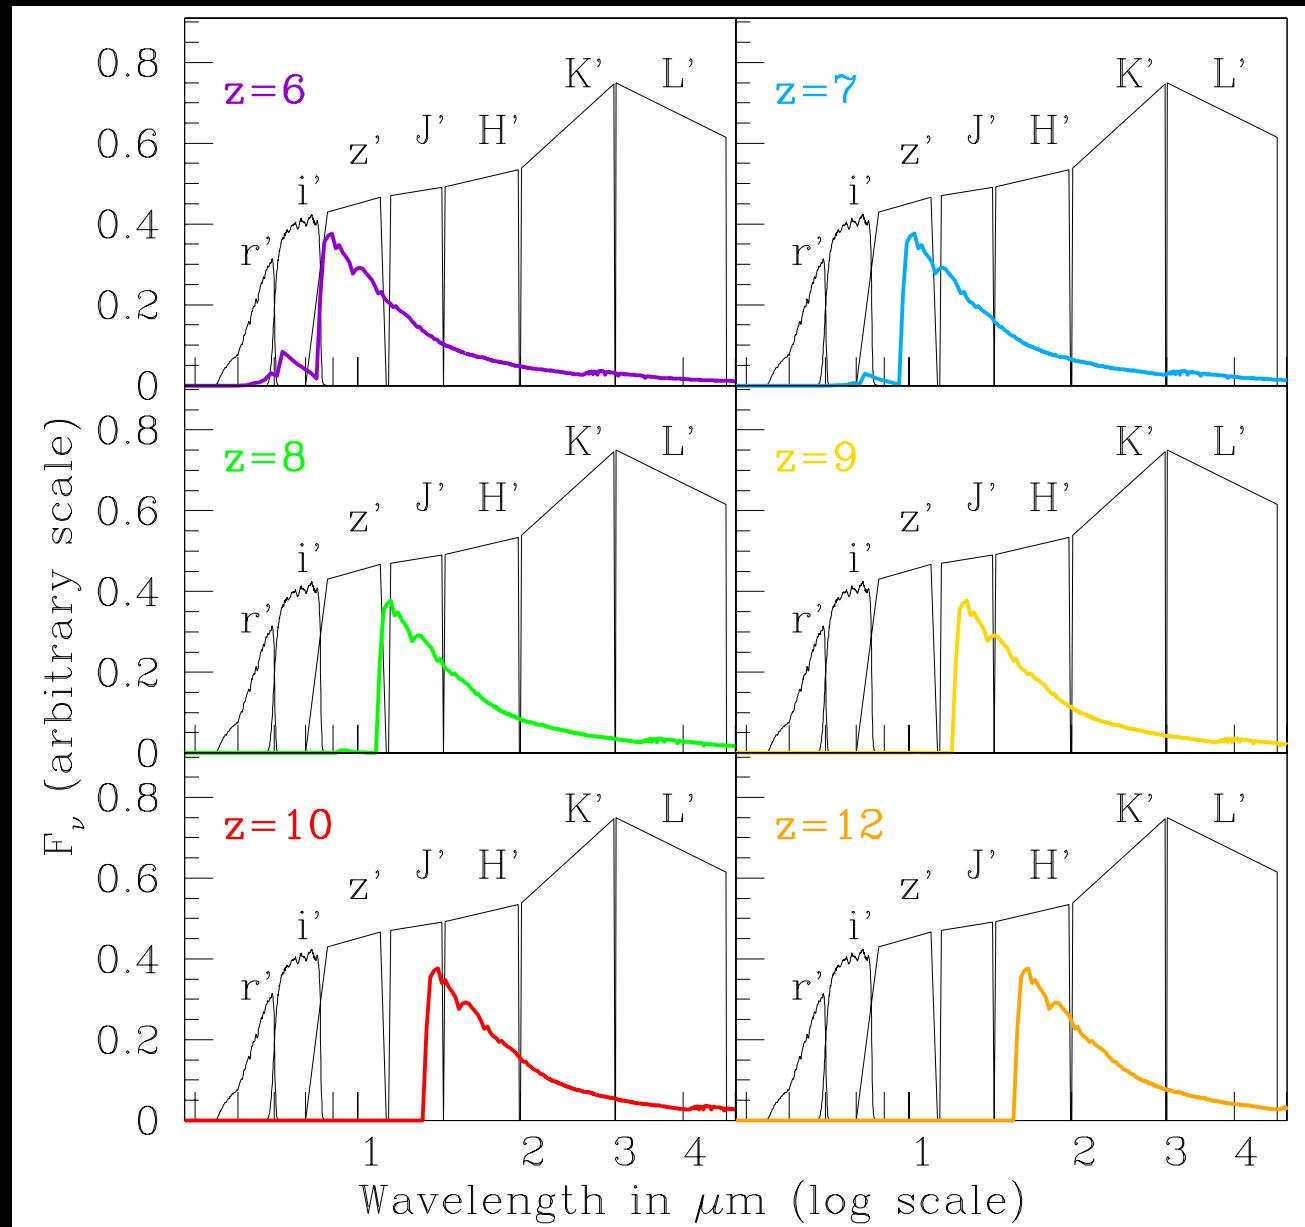

(3) How will JWST Observe First Light and Reionization?

- Detailed cosmological models (V. Bromm) suggest that massive “Pop III” stars ($\gtrsim 100 M_{sun}$) started to reionize the universe at $z \lesssim 10-30$ (First Light).
- This should be visible to JWST as the first Pop III stars or surrounding (Pop II.5) star clusters, and perhaps their extremely luminous supernovae at $z \simeq 10 \rightarrow 30$.

We must make sure that we theoretically understand the likely Pop III mass-range, their IMF, their duplicity and clustering properties, their SN-rates, etc., before JWST flies, so we know what to look for.

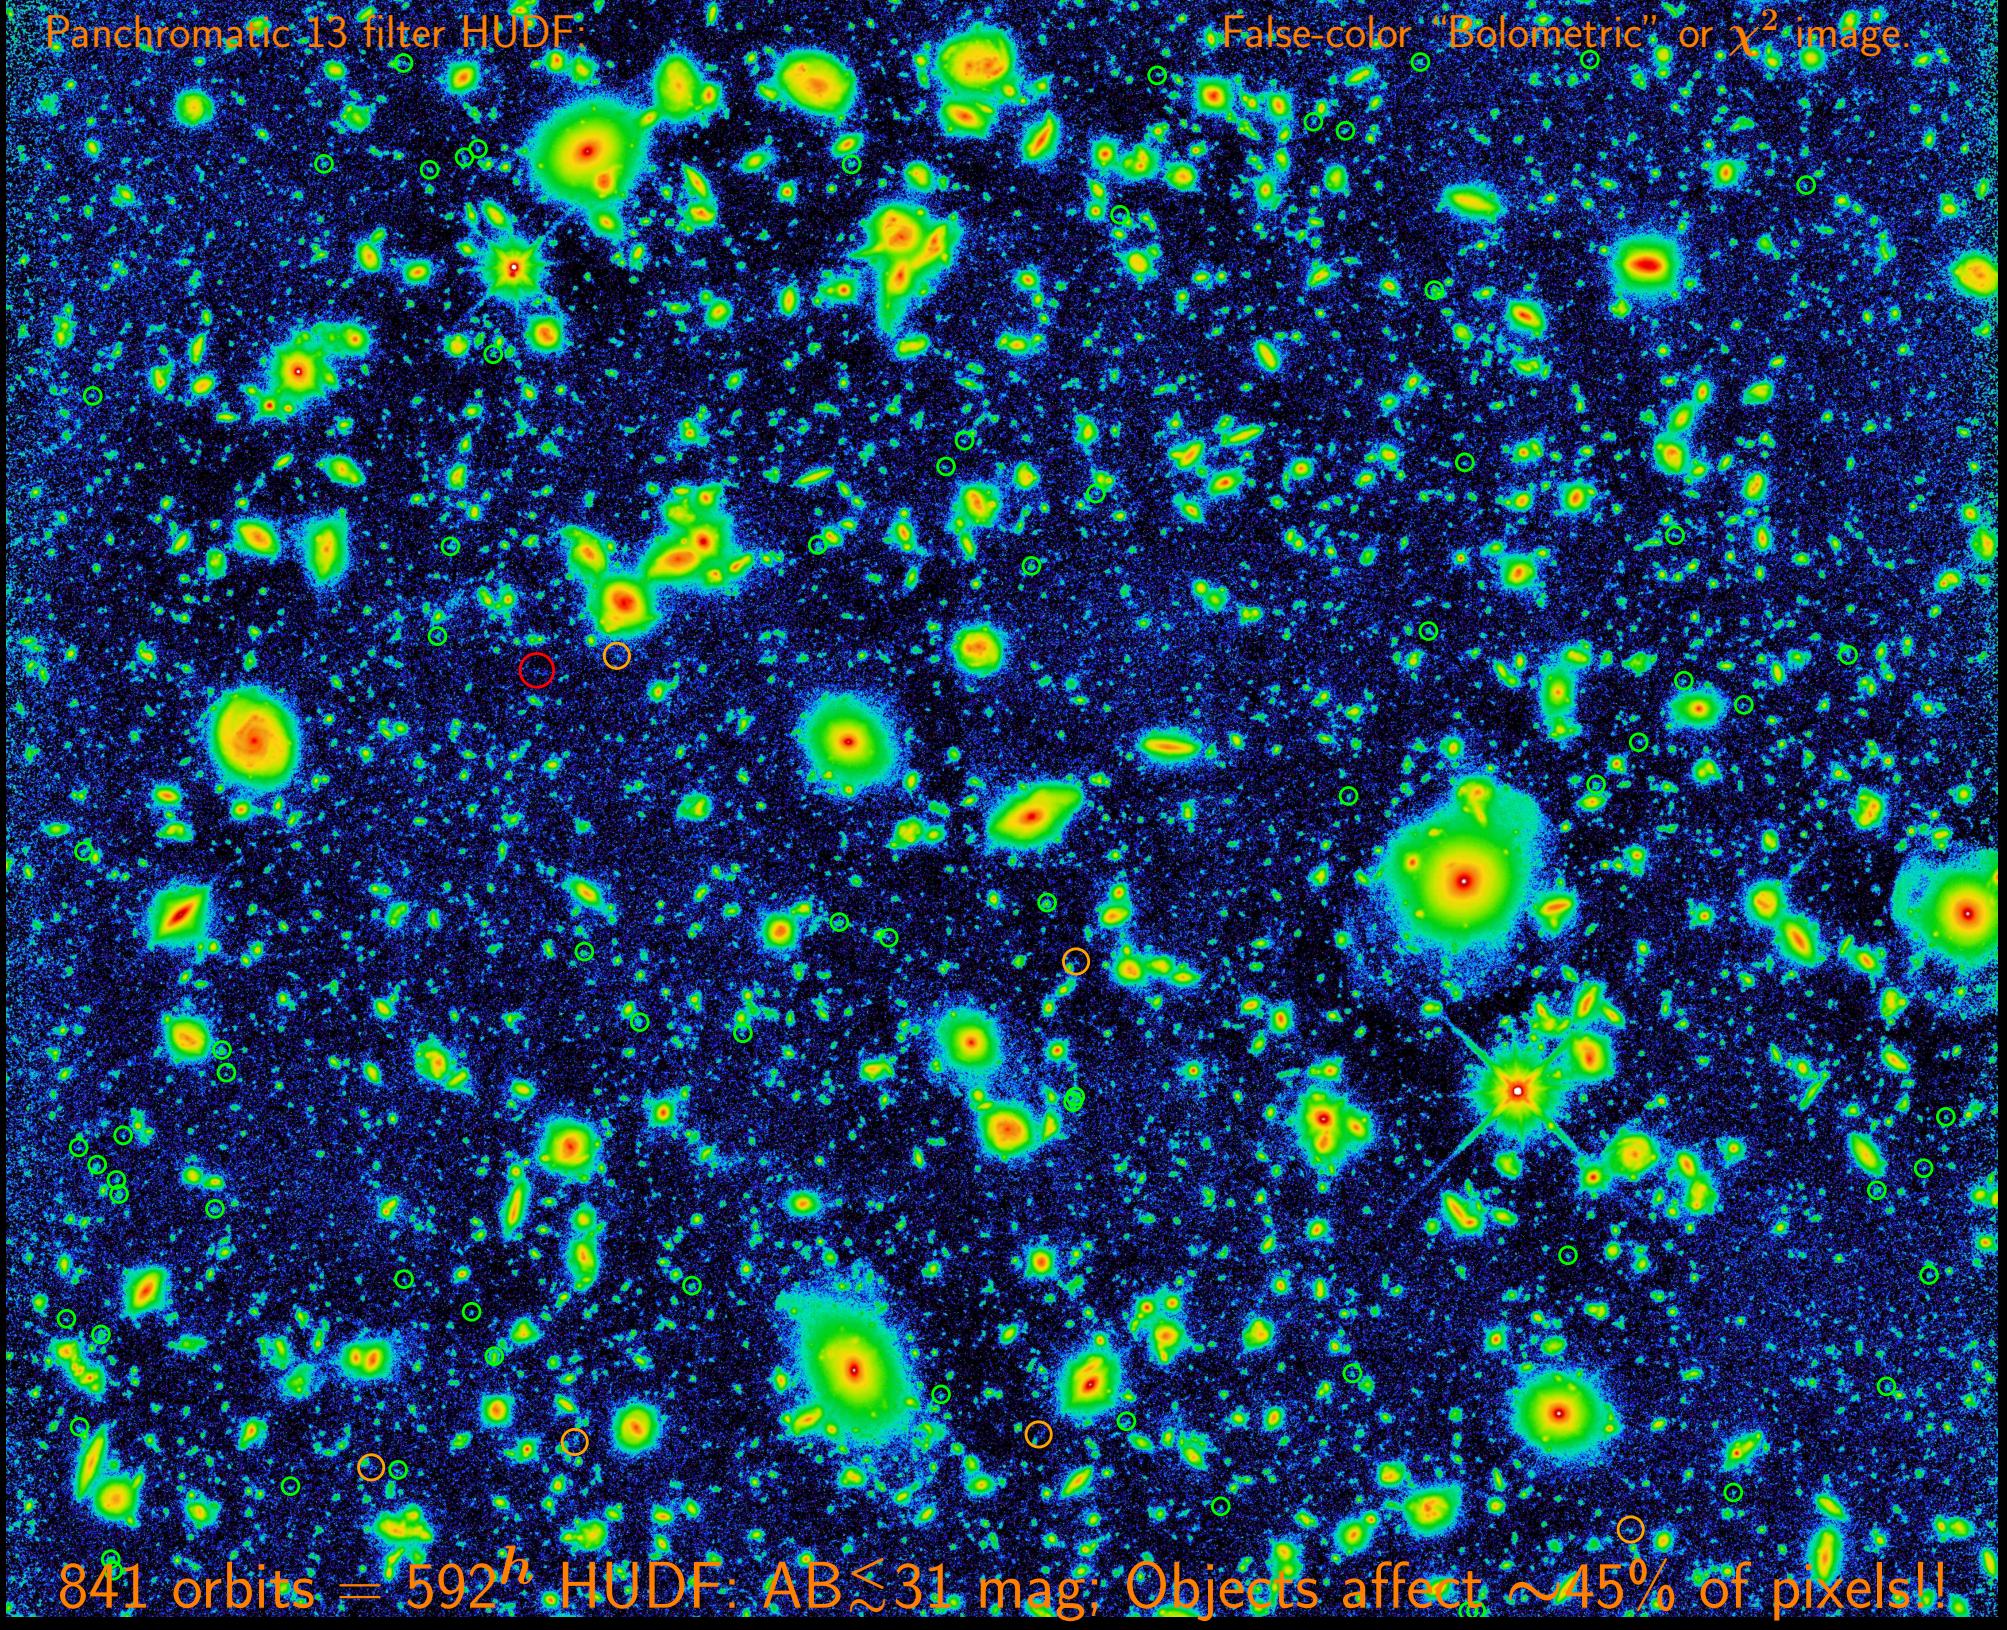

3) How will Webb measure First Light: What to expect in (Ultra)Deep Fields?

- Can't beat redshift: to see First Light, must observe near-mid IR.
⇒ This is why JWST needs NIRCam at 0.8–5 μm and MIRI at 5–28 μm .

Panchromatic 13 filter HUDF

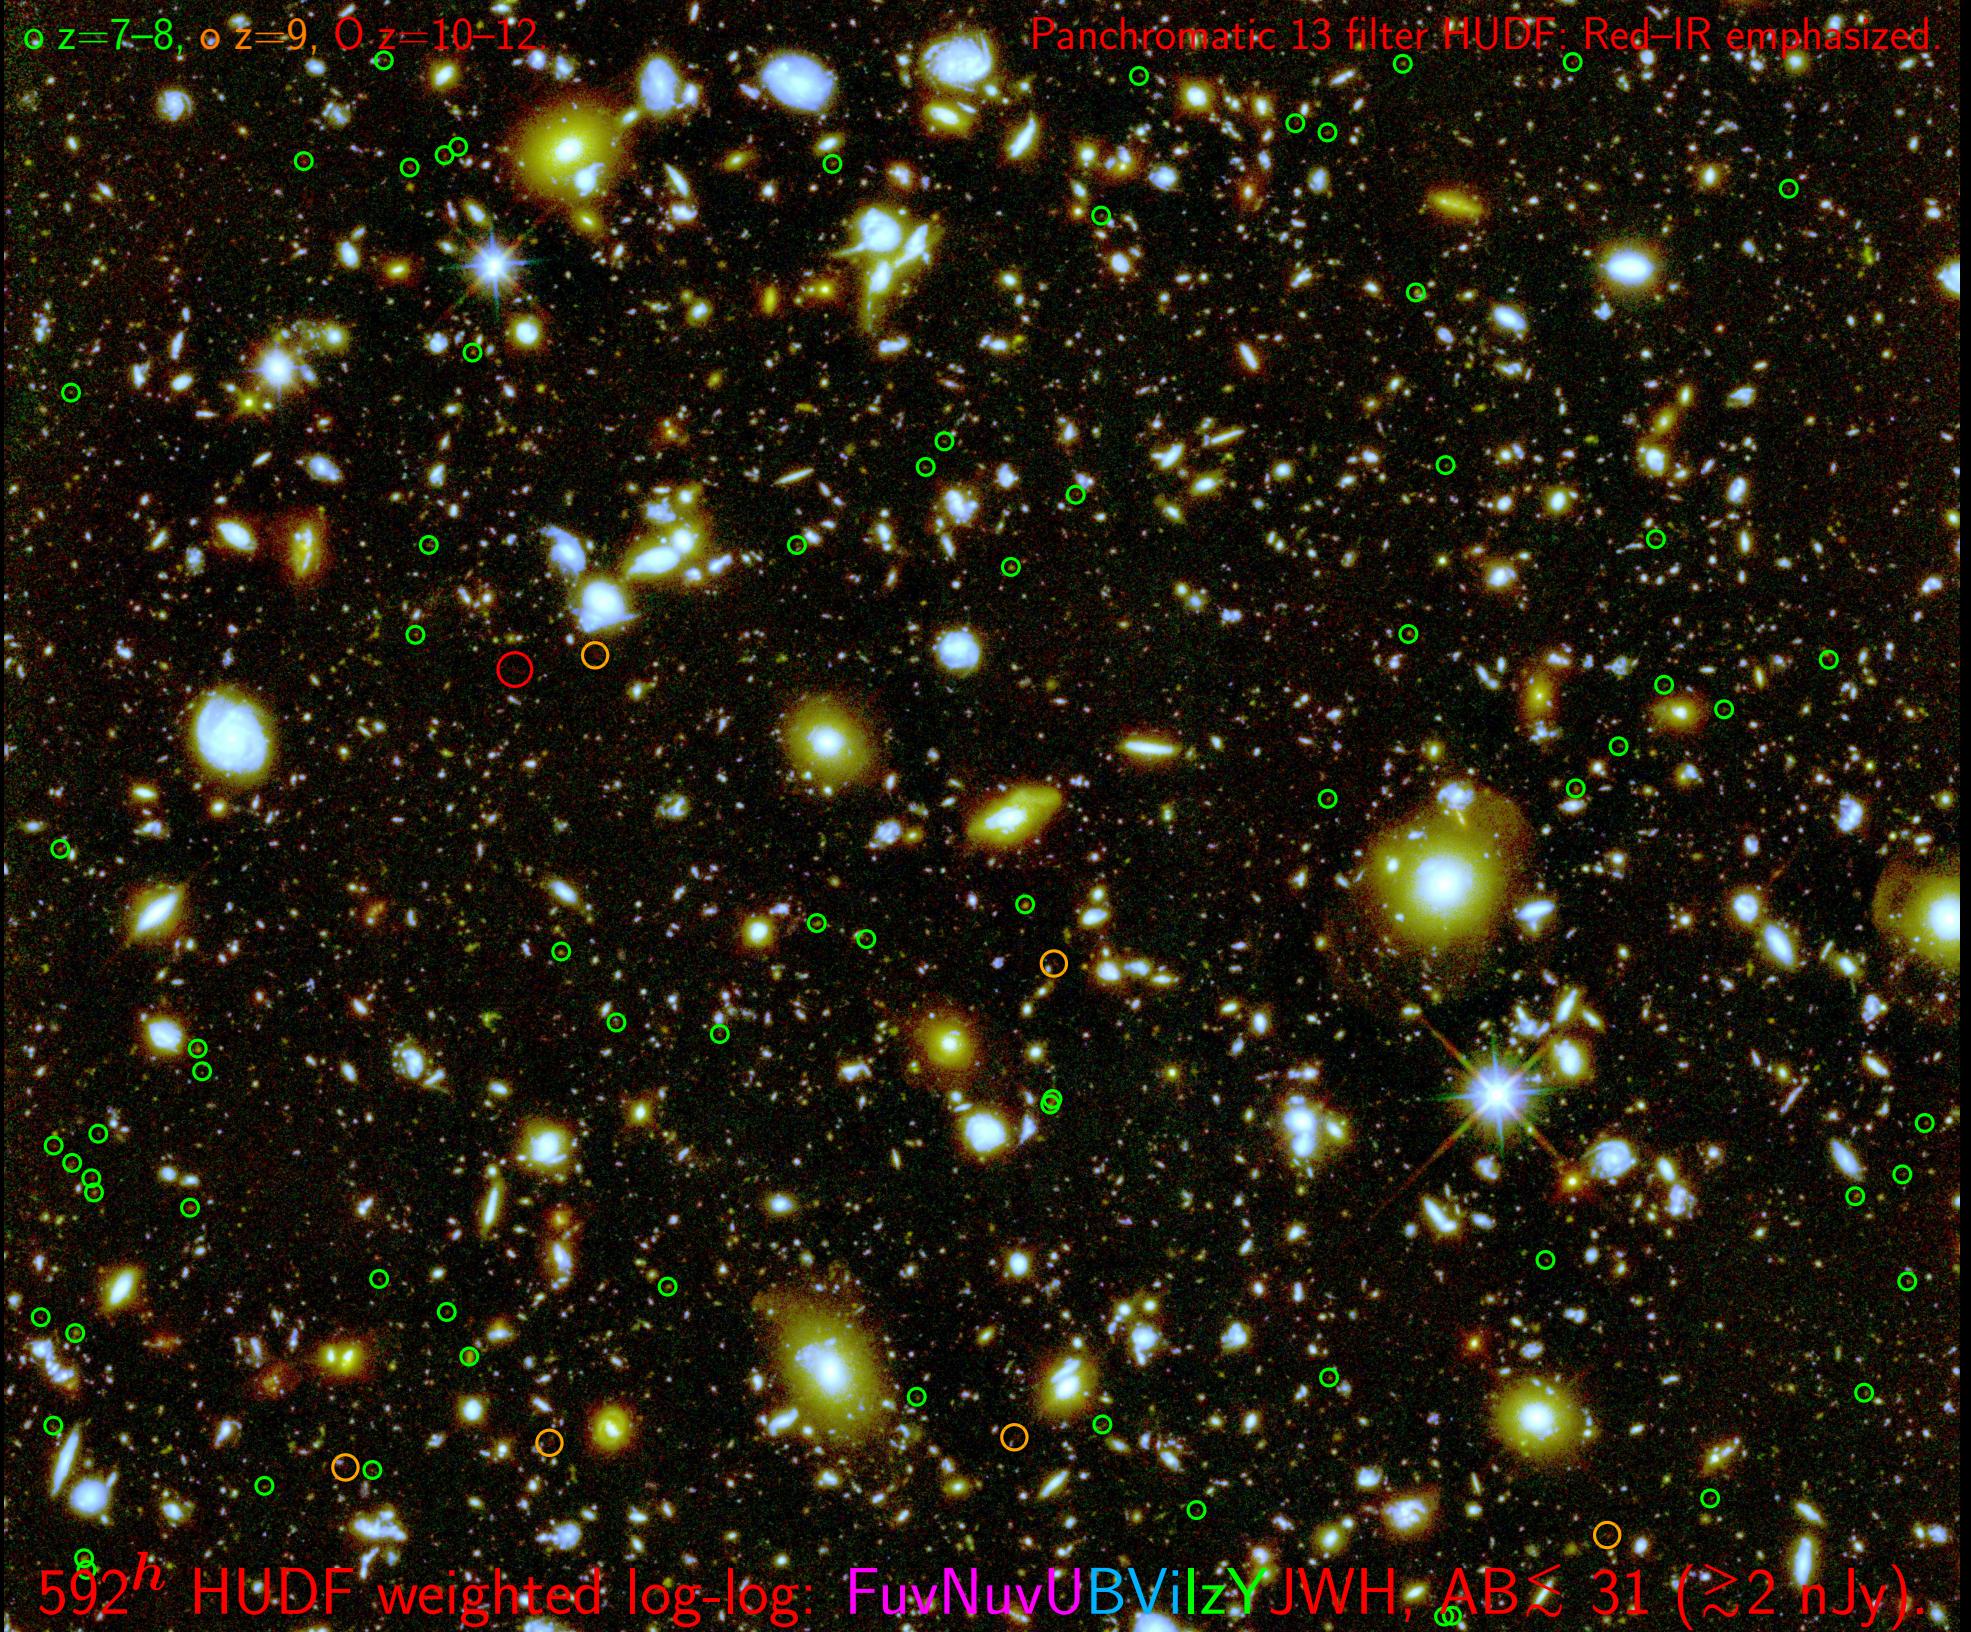

False-color "Bolometric" or χ^2 image.

841 orbits = 592^h HUDF: AB \lesssim 31 mag; Objects affect \sim 45% of pixels!!

○ $z=7-8$, ○ $z=9$, ○ $z=10-12$.

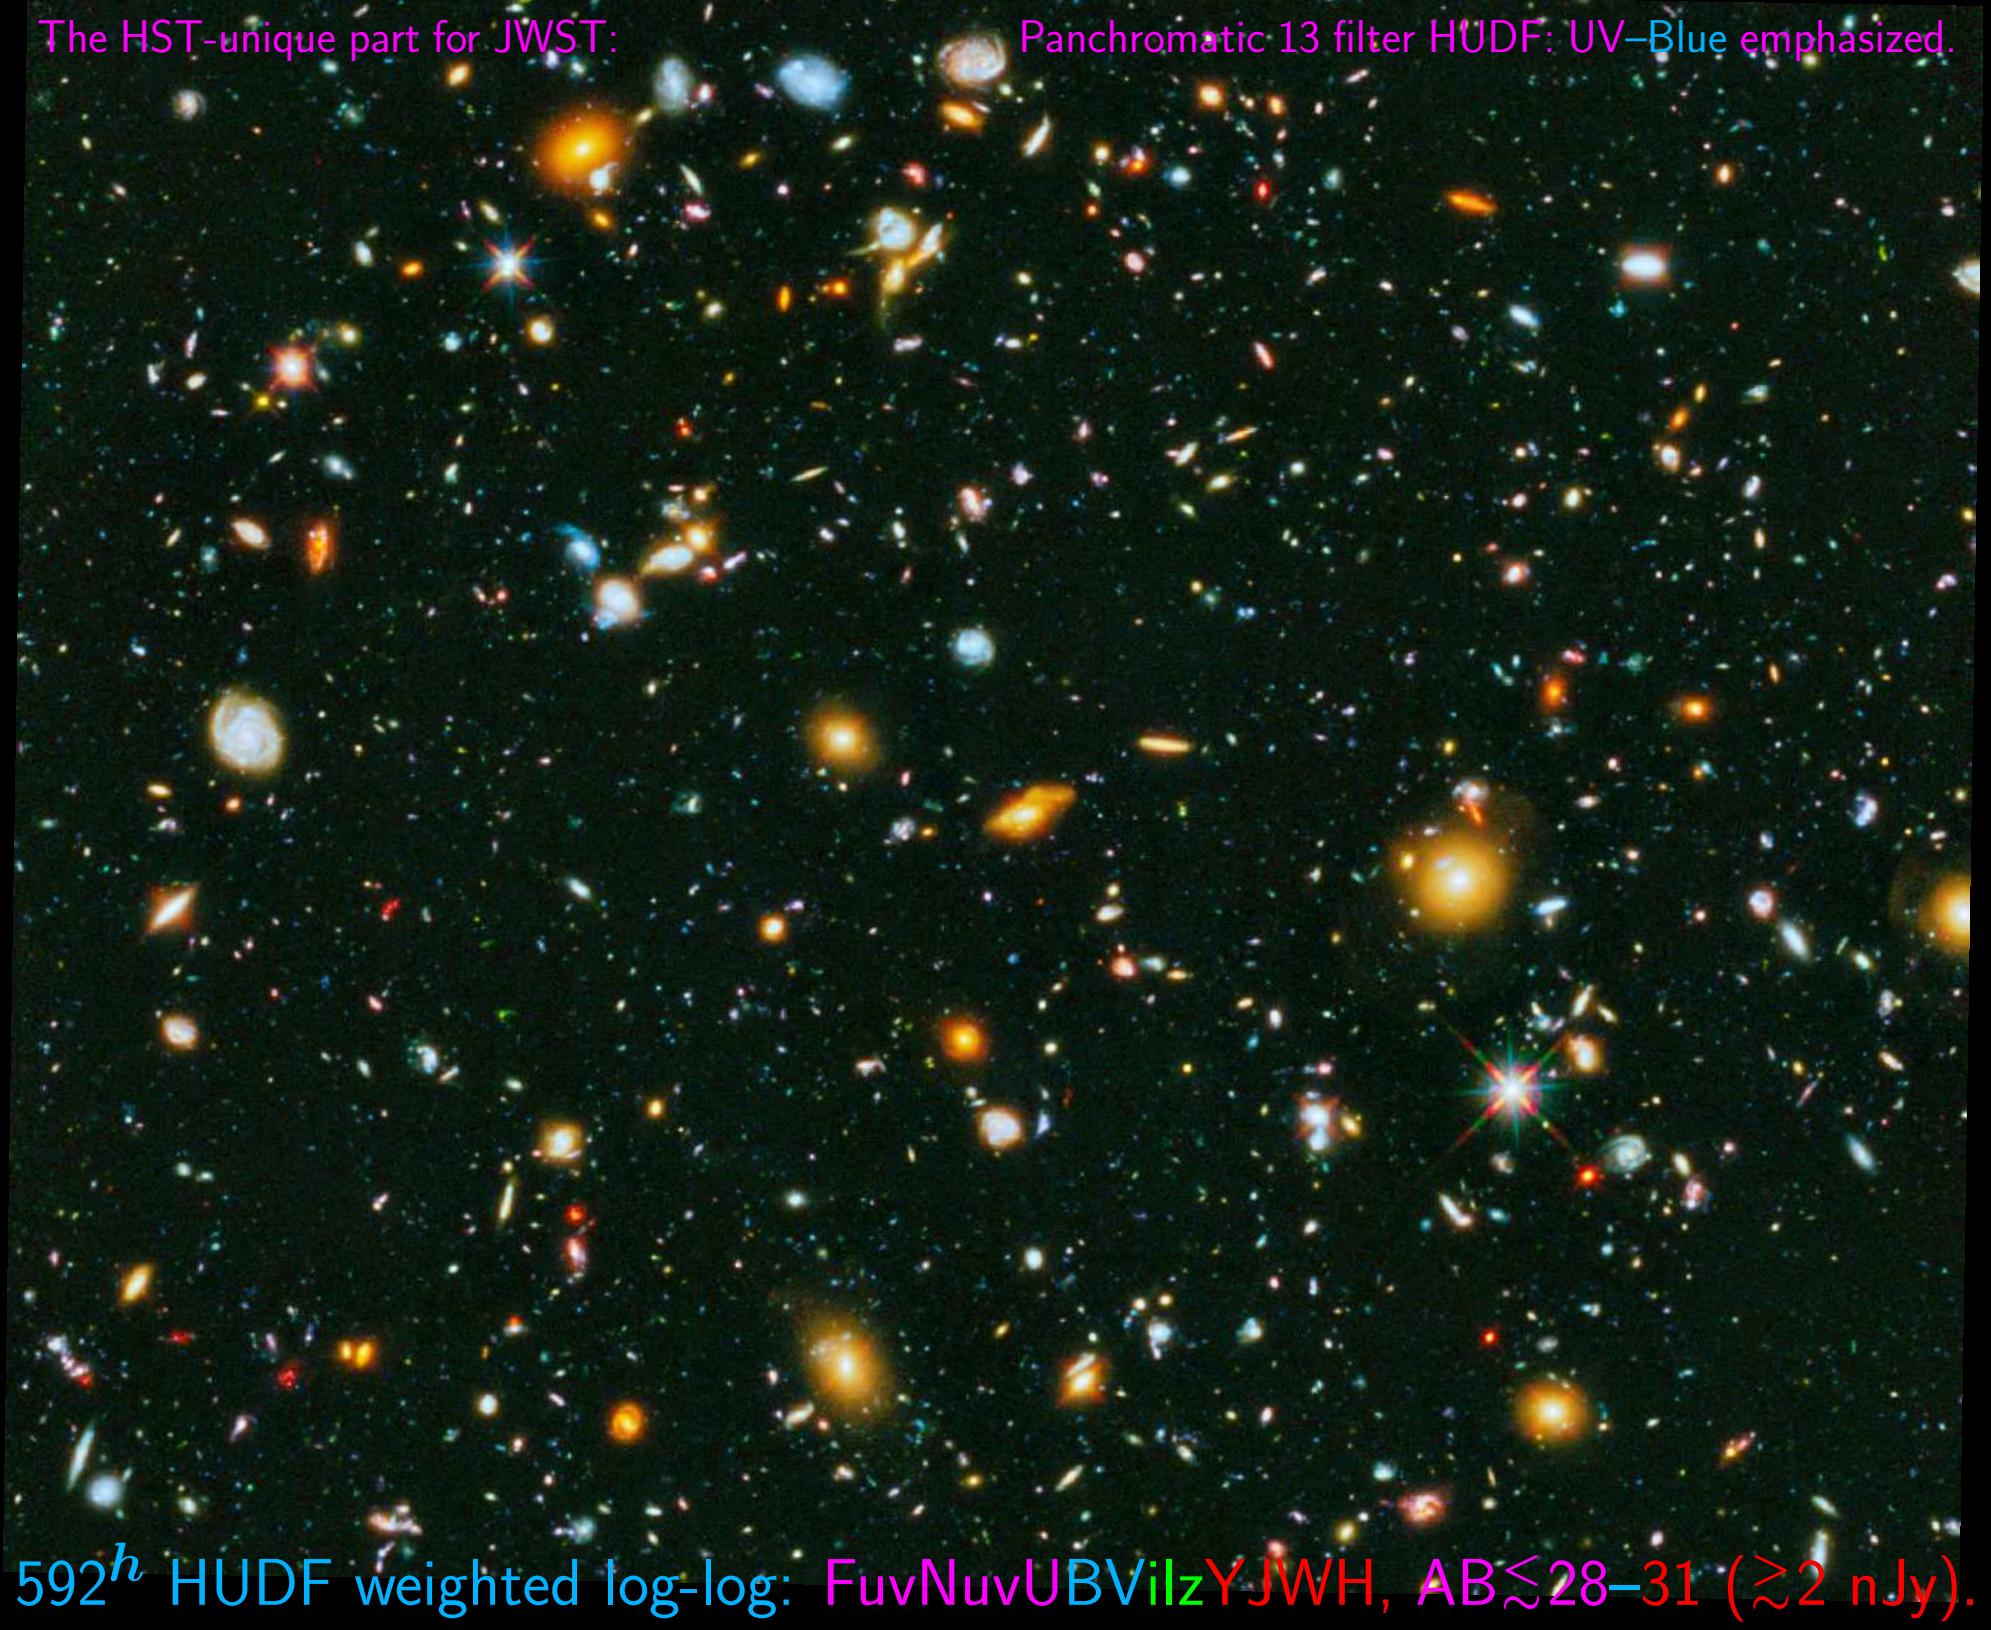

Panchromatic 13 filter HUDF; Red-IR emphasized.

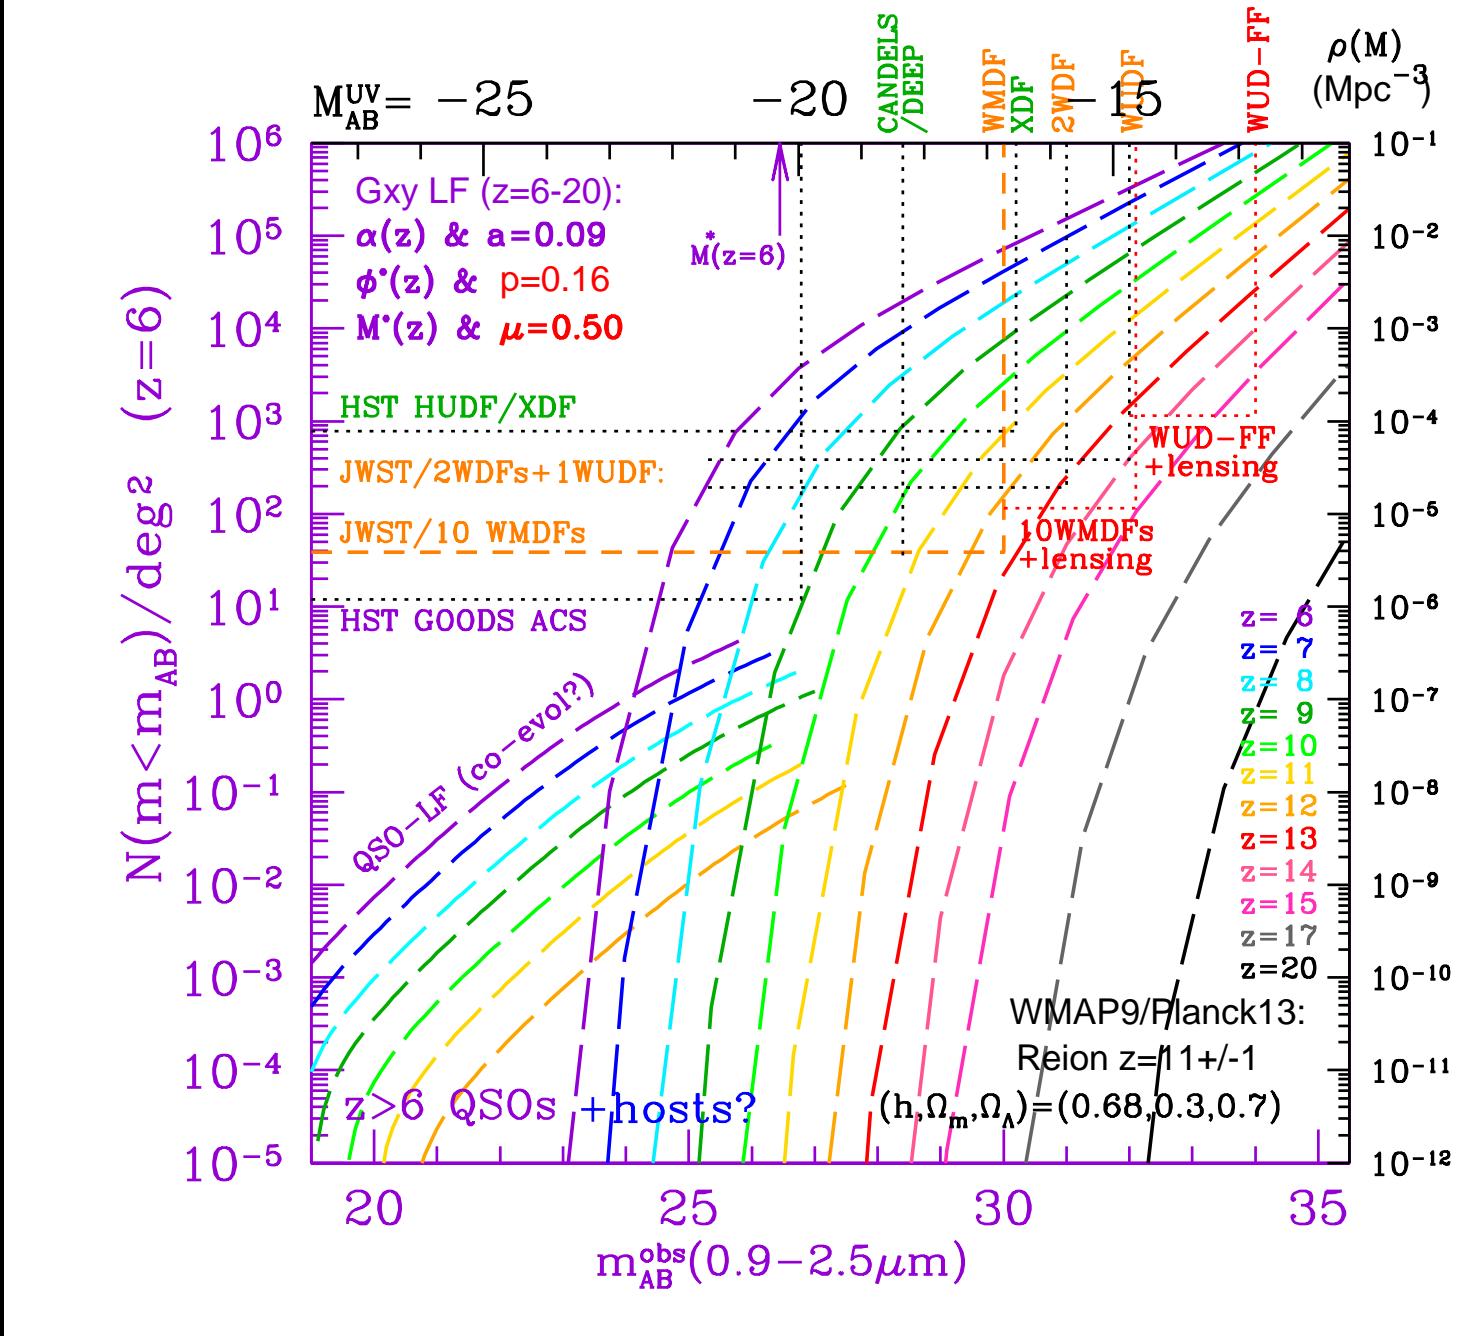

592^h HUDF weighted log-log: FuvNuvUBVilzYJWH, AB $\lesssim 31$ ($\gtrsim 2$ nJy).

The HST-unique part for JWST:

Panchromatic 13 filter HUDF: UV-Blue emphasized.

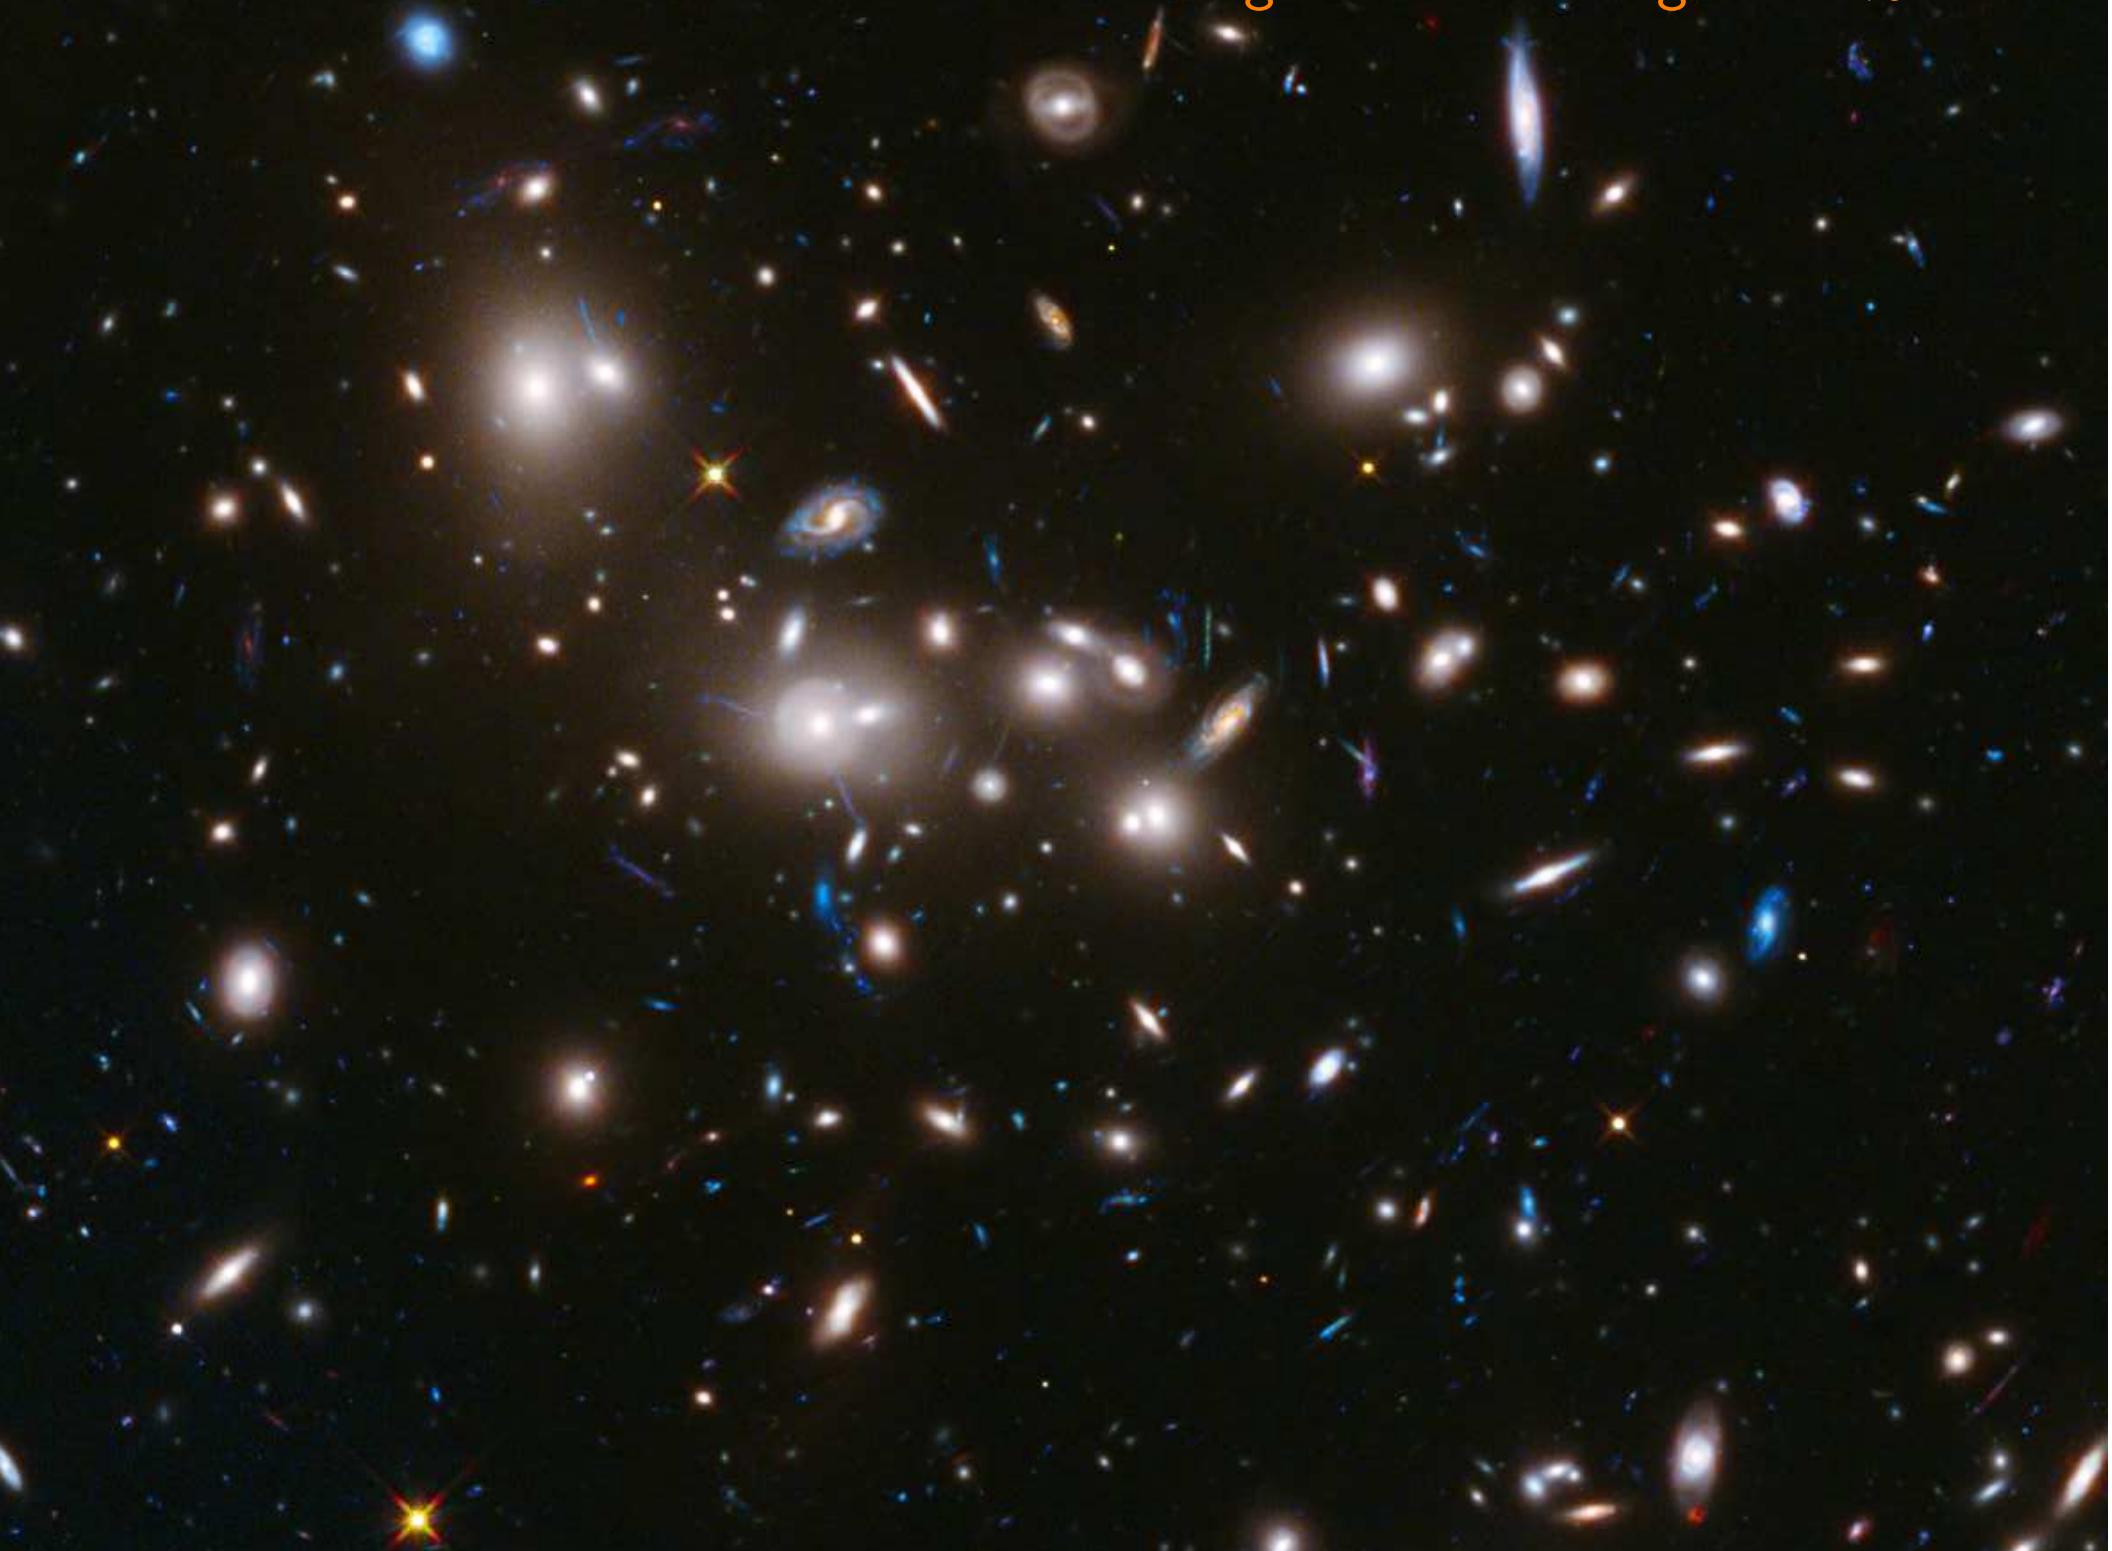

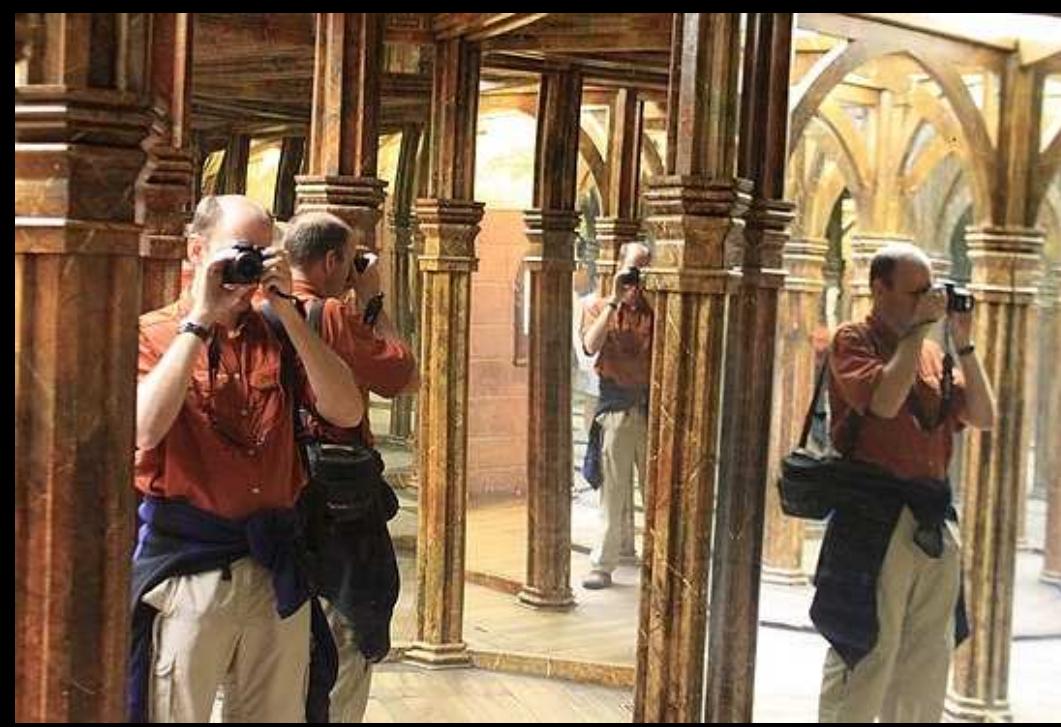

592^h HUDF weighted log-log: FuvNuvUBViIzYJWH, AB \lesssim 28–31 (\gtrsim 2 nJy).

Schechter LF ($z \lesssim 6 \lesssim 20$) with best-fit $\alpha(z)$, $\Phi^*(z)$, $M^*(z)$ & $\mu=0.50$.
 Area/Sensitivity for: HUDF/XDF, 10 WMDFs, 2 WDFs, & 1 WUDF.
 ● May need lensing targets for WMDF–WUDFF to see $z \simeq 14$ –16 objects!

HST Frontier Field A2744: JWST needs lensing to see First Light at $z \gtrsim 11-15$.

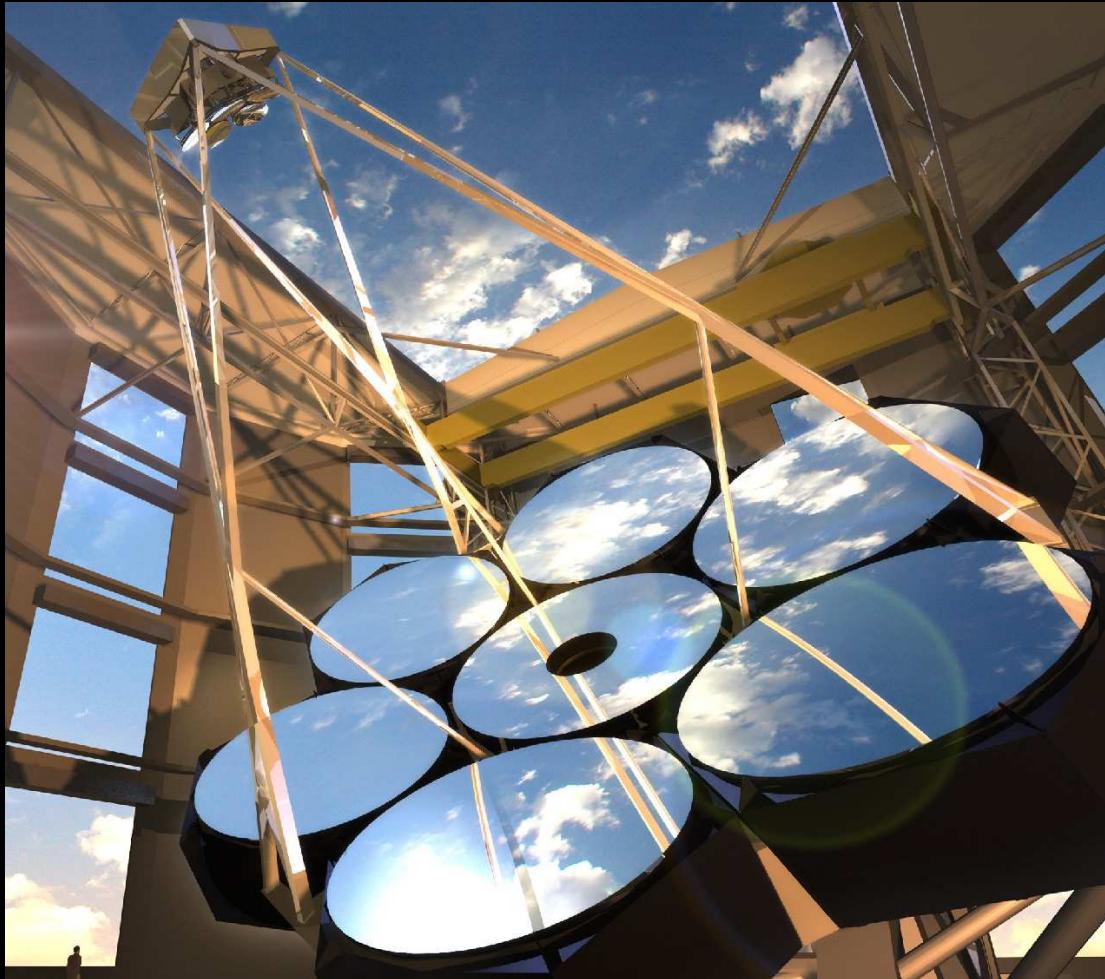

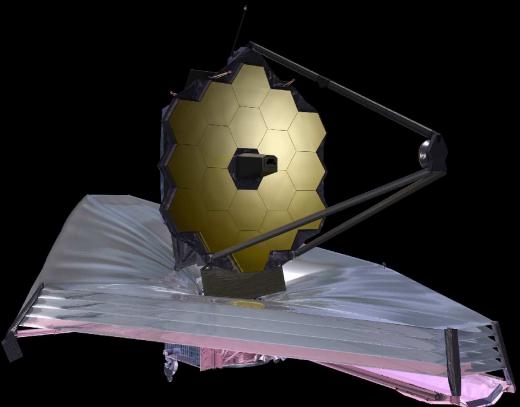

Two fundamental limitations may determine ultimate JWST image depth:

- (1) Cannot-see-the-forest-for-the-trees effect [Natural Confusion limit]:
Background objects blend into foreground because of their own diameter
⇒ Need multi- λ deblending algorithms.
- (2) House-of-mirrors effect [“Gravitational Confusion”]: Most First Light objects at $z \gtrsim 12-14$ may need to be found by cluster or group lensing.
⇒ Need multi- λ object-finder that works on sloped backgrounds.
⇒ If $M^*(z \gtrsim 10) \gtrsim -18$, need to use & model gravitational foreground.

(4) Future: Next generation 20-39 m ground-based telescopes and ATLAST

True relative size: Hubble, James Webb, & Giant Magellan Telescope

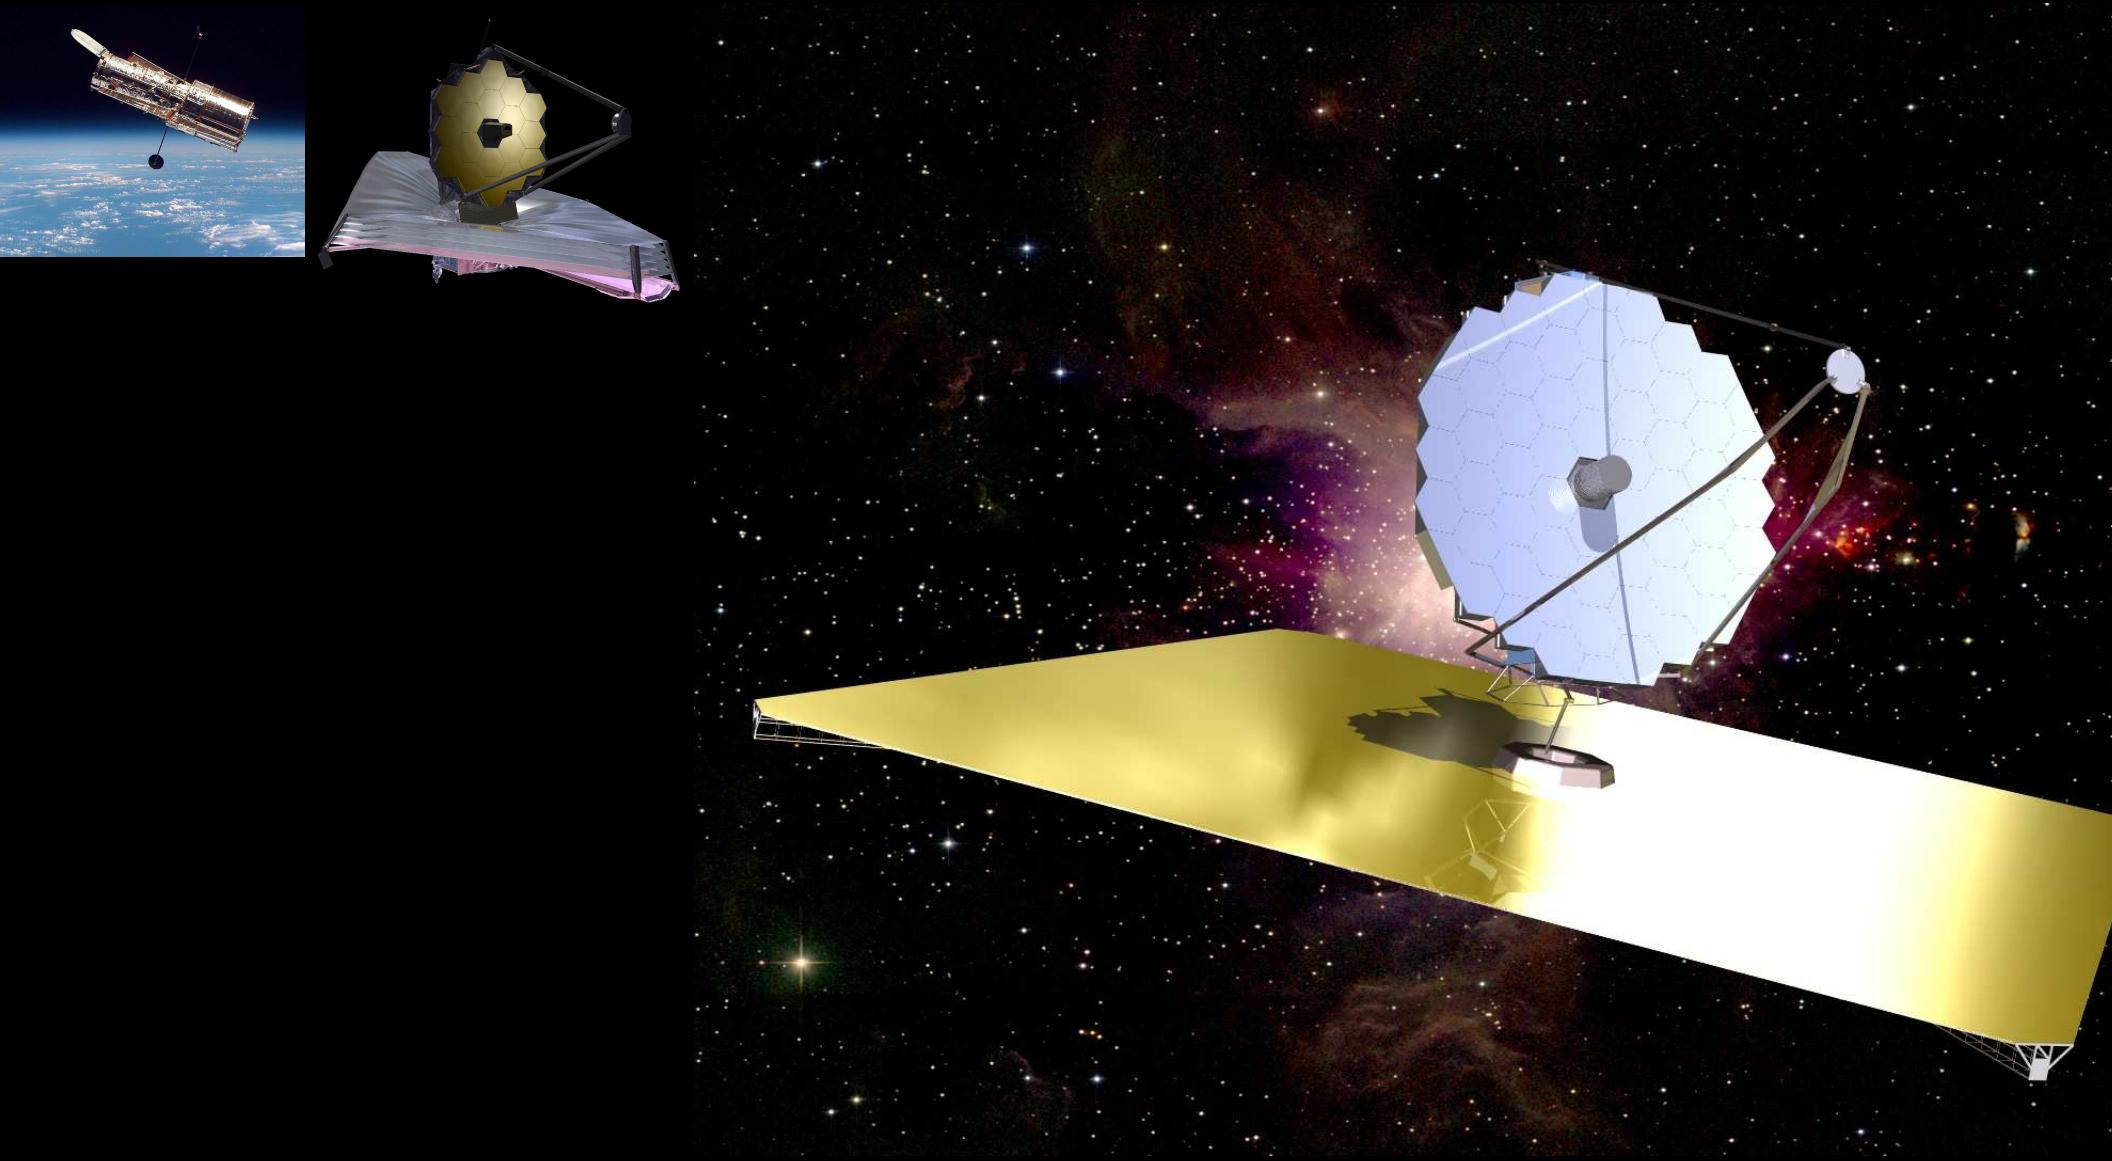

18 B\$ (1973~2018); 9 B\$ (1996~2029);

\sim 1 B\$ (2000~2050 $^+$).

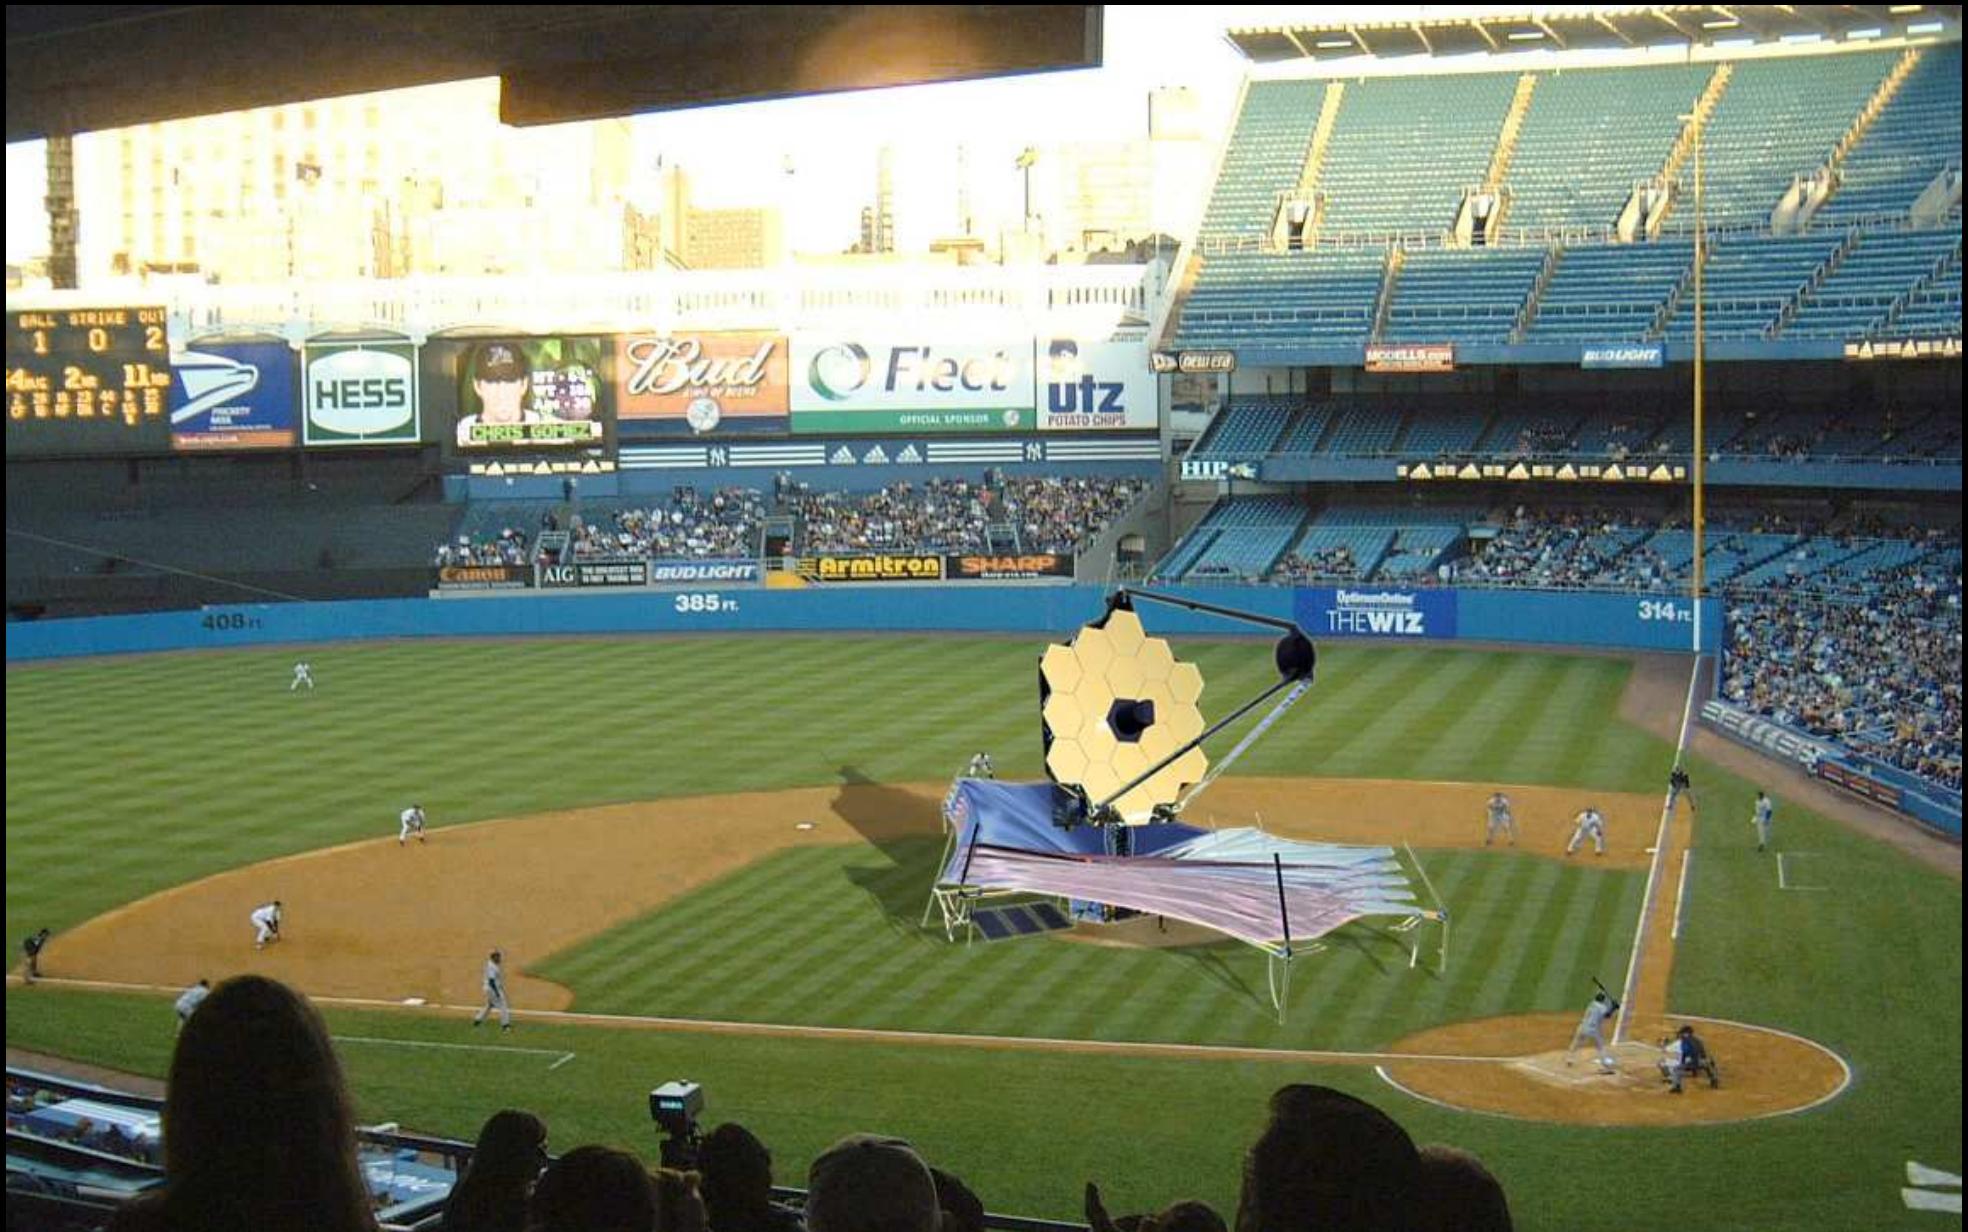

(4) Future: Next generation 20-39 m ground-based telescopes and ATLAST

True relative size: Hubble, James Webb, and ATLAST ...

18 B\$ (1973~2018); 9 B\$ (1996~2029); 15–20 B\$ (2020~2050+?).

(4) Future: How can we knock it out of the ball-park in the next 30 years?

Each of GMT and ATLAST facility nearly fills the whole Yankee ballpark ...

- New paradigm: They are too large for an individual university to take on.
- Universities need to collaborate nation-wide to make this happen.

(5) What do our Astrophysics College Graduates do?

Future Careers at NASA:

- Over the last 25 years, (ASU) Astrophysics College Graduates typically:
- (0) Have very low unemployment (\lesssim few %).
- (1) About 30% are faculty at Universities or 4-year colleges.
- (2) About 30% are researchers at NASA or other government centers.
- (3) About 20% work in Aerospace or related industries.
- (4) About 20% are faculty at Community Colleges or Highschools.

CS Head Count

as values

NASA workforce as pie-chart and in numbers — 2013 total: about 18,000).

Nation-wide NASA contractors (Northrup, Lockheed, Boeing, etc): 150,000.

See also: <https://wicn.nssc.nasa.gov/generic.html>

(6) Summary and Conclusions

(1) HST set stage to measure galaxy assembly in the last 12.7-13.0 Gyrs.

- Most $z \simeq 6$ QSO host galaxies faint (dusty?), with 1 exception: $L >> L^*$.

(2) JWST passed Preliminary & Critical Design Reviews in 2008 & 2010.

Management replan in 2010-2011. No technical showstoppers thus far:

- More than 97% of JWST H/W built or in fab, & meets/exceeds specs.

(3) JWST is designed to map the epochs of First Light, Reionization, and Galaxy Assembly & SMBH-growth in detail. JWST will determine:

- Formation and evolution of the first star-clusters after 0.2 Gyr.
- How dwarf galaxies formed and reionized the Universe after 1 Gyr.

(4) JWST will have a major impact on astrophysics this decade:

- IR sequel to HST after 2018: Training the next generation researchers.
- JWST will define the next frontier to explore: the Dark Ages at $z \gtrsim 20$.

What the Scientists See:

What the Project Manager Sees:

The Happy Balance

Found at GP3A.CX

Any (space) mission is a balance between what science demands, what technology can do, and what budget & schedule allows ... (courtesy Prof. R. Ellis).

Northrop Grumman Expertise in Space Deployable Systems

- Over 45 years experience in the design, manufacture, integration, verification and flight operation of spacecraft deployables
- 100% mission success rate, comprising over 640 deployable systems with over 2000 elements

Baseline "Cup Down" Tower Configuration at JSC (Before)

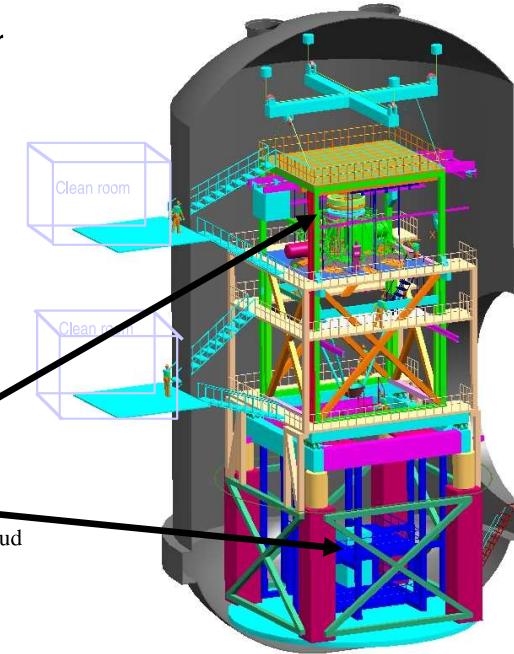

Most recent Tower Design shows an Inner Optical Tower supported by a Outer structure with Vibration Isolation at the midplane. Everything shown is in the 20K region (helium connections, etc. not shown) except clean room and lift fixture.

Current plan calls for 33KW cooldown capability, 12 KW steady state, 300-500mW N2 cooling

JSC currently has 7 KW He capability

Current plan includes 10 trucks of LN2/day during cooldown

Interferometers, Sources, Null Lens and Alignment Equipment Are in Upper and Lower Pressure Tight Enclosure Inside of Shroud

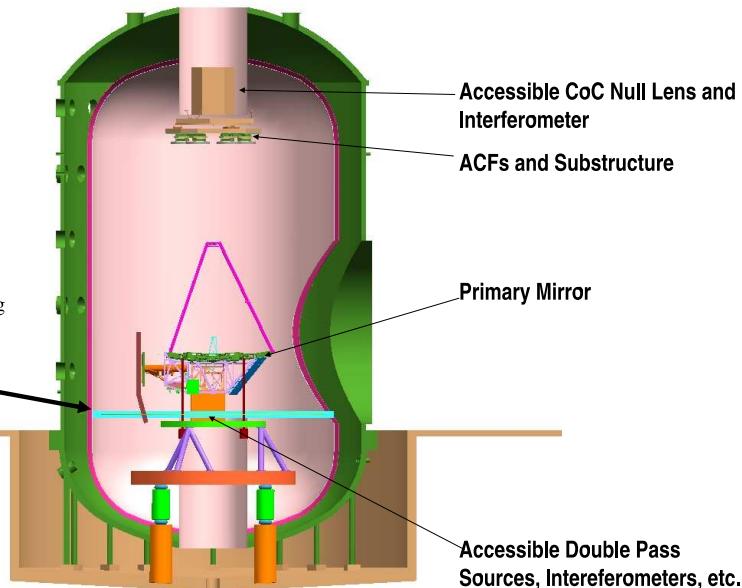

JSC "Cup Up" Test Configuration (New Proposal)

No Metrology Tower and Associated Cooling H/W. External Metrology

Two basic test options:

1. Use isolators, remove drift through fast active control + freeze test equipment jitter
 2. Eliminate vibration isolators (but use soft dampeners) to avoid drift, freeze out jitter
- Builds on successful AMSD heritage of freezing and averaging jitter, testing through windows.

Drawing care of ITT

Page 6

JWST underwent several significant replans and risk-reduction schemes:

- ≈2003: Reduction from 8.0 to 7.0 to 6.5 meter. Ariane-V launch vehicle.
- 2005: Eliminate costly 0.7-1.0 μm performance specs (kept 2.0 μm).
- 2005: Simplification of thermal vacuum tests: cup-up, not cup-down.
- 2006: All critical technology at Technical Readiness Level 6 (TRL-6).
- 2007: Further simplification of sun-shield and end-to-end testing.
- 2008: Passes Mission Preliminary Design & Non-advocate Reviews.
- 2010, 2011: Passes Mission Critical Design Review: Replan Int. & Testing.

Fiscal Year 2014 HQ Milestones

Assumes JWST is appropriated in FY2014 the full President's budget request of new obligation authority (NOA).

Month	Milestone	Comment
Oct-13	1 Primary Mirror Backplane Support Structure Cryogenic Testing Readiness Review	Completed 9/10
	2 Mirror Deployment Electronics Unit Manufacturing Readiness Review	Completed 10/8
Nov-13	3 Jet Propulsion Lab. (JPL) Cryogenic Test Chamber Readiness Review	Delayed: pulse tube, cooler shield issues
	4 Johnson Space Center (JSC) Telescope and ISIM support structure fabrication complete	Completed 11/4
Dec-13	5 Spacecraft Critical Design Review Complete	Delayed to 1/14 [shutdown]
	6 MIRI Cryocooler Flight Cold Head Assembly delivered to ISIM	Delayed 1/21/2014
	7 JSC Clean Room ready to receive ground support equipment	Delayed to 1/14 [shutdown]
	8 Complete ISIM cryogenic-vacuum risk reduction test	Concluded 11/13/2013, but not all tests completed because of shutdown
Jan-14	9 Delivery of last Primary Mirror Segment to GSFC	Completed 12/16
	10 Observatory Operations software scripts Build 3 Complete	
	11 New detector focal plane arrays for NIRCam ready for integration into instrument	Completed 11/20
Feb-14	12 Secondary Mirror Mount delivery	
	13 MIRI Cryocooler flight electronics delivered to JPL	Completed 11/22
	14 Final Data Management Subsystem Design Review	
	15 Flight NIRCam and NIRSpec ready for integration into ISIM	Delayed to 3/14 [shutdown]
Mar-14	16 Spacecraft Solar Array Manufacturing Readiness Review	
	17 JSC Chamber A Telescope ground support equipment test #1 design review	
Apr-14	18 Telescope actuators electronics drive unit delivery	
	19 Flight MIRI cryocooler assembly delivered to JPL	
	20 MIRI Cryocooler Flight Refrigerant Line Deployment Assembly delivered to integration and testing	
	21 Sunshield Membrane Cover Assembly Manufacturing Readiness Review	
	22 MIRI cryocooler Test Readiness Review	
May-14	23 Updated Observatory Commissioning Plan (rev C) delivery	
	24 Start acceptance testing of flight cryocooler assembly and associated electronics	
	25 Start cryo-vacuum test with fully integrated ISIM ("CV2")	Delayed to 6/14 [shutdown]
Jun-14	26 Flight spare MIRI cryocooler assembly delivered to JPL	
	27 JSC Chamber A bake-out and cryogenic proof testing complete	
	28 Hardware ready for MIRI cryo cooler test #3: checkout complete	
Jul-14	29 Spacecraft Mid-Course Correction Thruster Final Assembly complete	
	30 Proposal Planning Subsystem build 9 complete	
	31 Sunshield Mid-boom and Stem assembly Manufacturing Readiness Review	
Aug-14	32 Spacecraft Flight Software Build 2.2 Test Readiness Review	
	33 NIRSpec and FGS/NIRISS new Focal Plane Arrays ready for integration	Delayed to 9/14 [shutdown]
	34 JSC cryogenic test telescope and ISIM test ground support equipment integration complete	
Sep-14	35 Complete cryo-vacuum test of fully integrated ISIM ("CV2")plete	Delayed to 10/14 [shutdown]
	36 NIRSpec new microshutters ready for integration	Delayed to 10/14 [shutdown]

Blue font denotes milestones accomplished ahead of schedule, orange font denotes milestones accomplished late.

Milestones: How the Project reports its progress monthly to Congress.

Milestone Performance

- Since the September 2011 replan JWST reports high-level milestones monthly to numerous stakeholders

	Total Milestones	Total Milestones Completed	Number Completed Early	Number Completed Late	Deferred to Next Year
FY2011	21	21	6	3	0
FY2012	37	34	16	2	3
FY2013	41	38	20	5	3
FY2014	36	7	5	10*	0

*Late milestones have been or are forecast to complete within the year.
Shutdown related delayed milestones included in this tally

7 out of 10 FY14 milestones late by 1 month due to Government shutdown.

None of these are on the critical path, so caused no launch delay.

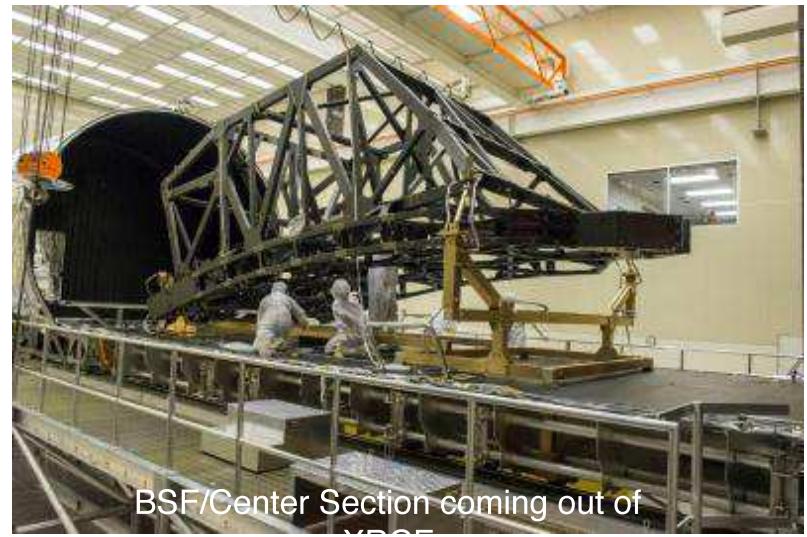

Backplane Support Frame, Center Section, & Wings

- Center Section is complete
- Wings and cryo cycling is complete
- BSF assembly is complete
- Integration of the BSF to Center Section Complete
 - Cryo Cycling at MSFC XRCF complete

BSF and Center Section

BSF/Center Section coming out of XRCF

2014: Flight back-plane ready to receive mirrors starting in Aug. 2014.

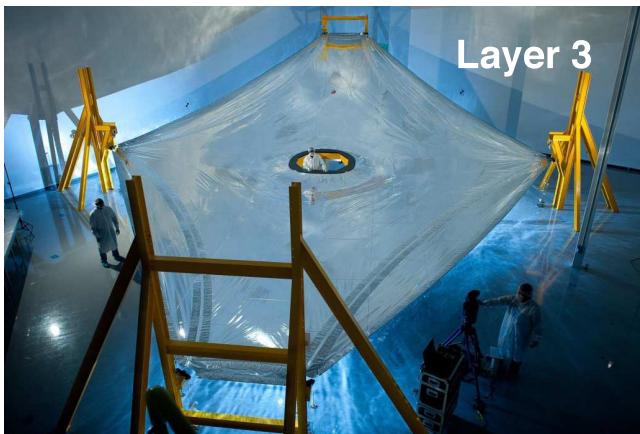

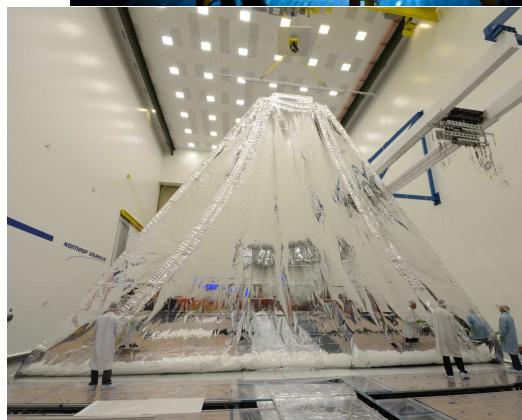

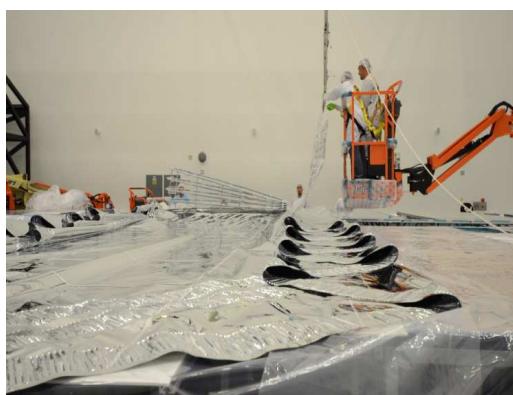

Sunshield Template Membrane Work Completed

Templates Verify Design/Manufacturing Prior to Flight Build

- All Template Layers Completed
- Preparing for flight article manufacturing
- First two Flight Manufacturing Readiness Reviews Completed
- Membrane pull out test complete

Stringing Operations

Template
Layers 3-5

Hole Tool Operations

Flight sunshield to be completed & tested by 2015 at Northrop (CA).

Telescope Assembly Ground Support Equipment

Ambient Optical Alignment Stand

Hardware has been installed
at GSFC approximately 8
weeks ahead of schedule

Page 14

July 2014: OTIS — World's largest TV chamber readied to test JWST.

<i>First light NIRCam</i>	<i>After Step 1</i>	<i>Initial Capture</i>	<i>Final Condition</i>
		<p>18 individual 1.6-m diameter aberrated sub-telescope images</p> <p>PM segments: < 1 mm, < 2 arcmin tilt</p> <p>SM: < 3 mm, < 5 arcmin tilt</p>	<p>PM segments: < 100 μm, < 2 arcsec tilt</p> <p>SM: < 3 mm, < 5 arcmin tilt</p>
2. Coarse Alignment Secondary mirror aligned Primary RoC adjusted		<p>Primary Mirror segments: < 1 mm, < 10 arcsec tilt</p> <p>Secondary Mirror : < 3 mm, < 5 arcmin tilt</p>	WFE < 200 μm (rms)
3. Coarse Phasing - Fine Guiding (PMSA piston)		WFE: < 250 μm rms	WFE < 1 μm (rms)
4. Fine Phasing		WFE: < 5 μm (rms)	WFE < 110 nm (rms)
5. Image-Based Wavefront Monitoring		WFE: < 150 nm (rms)	WFE < 110 nm (rms)

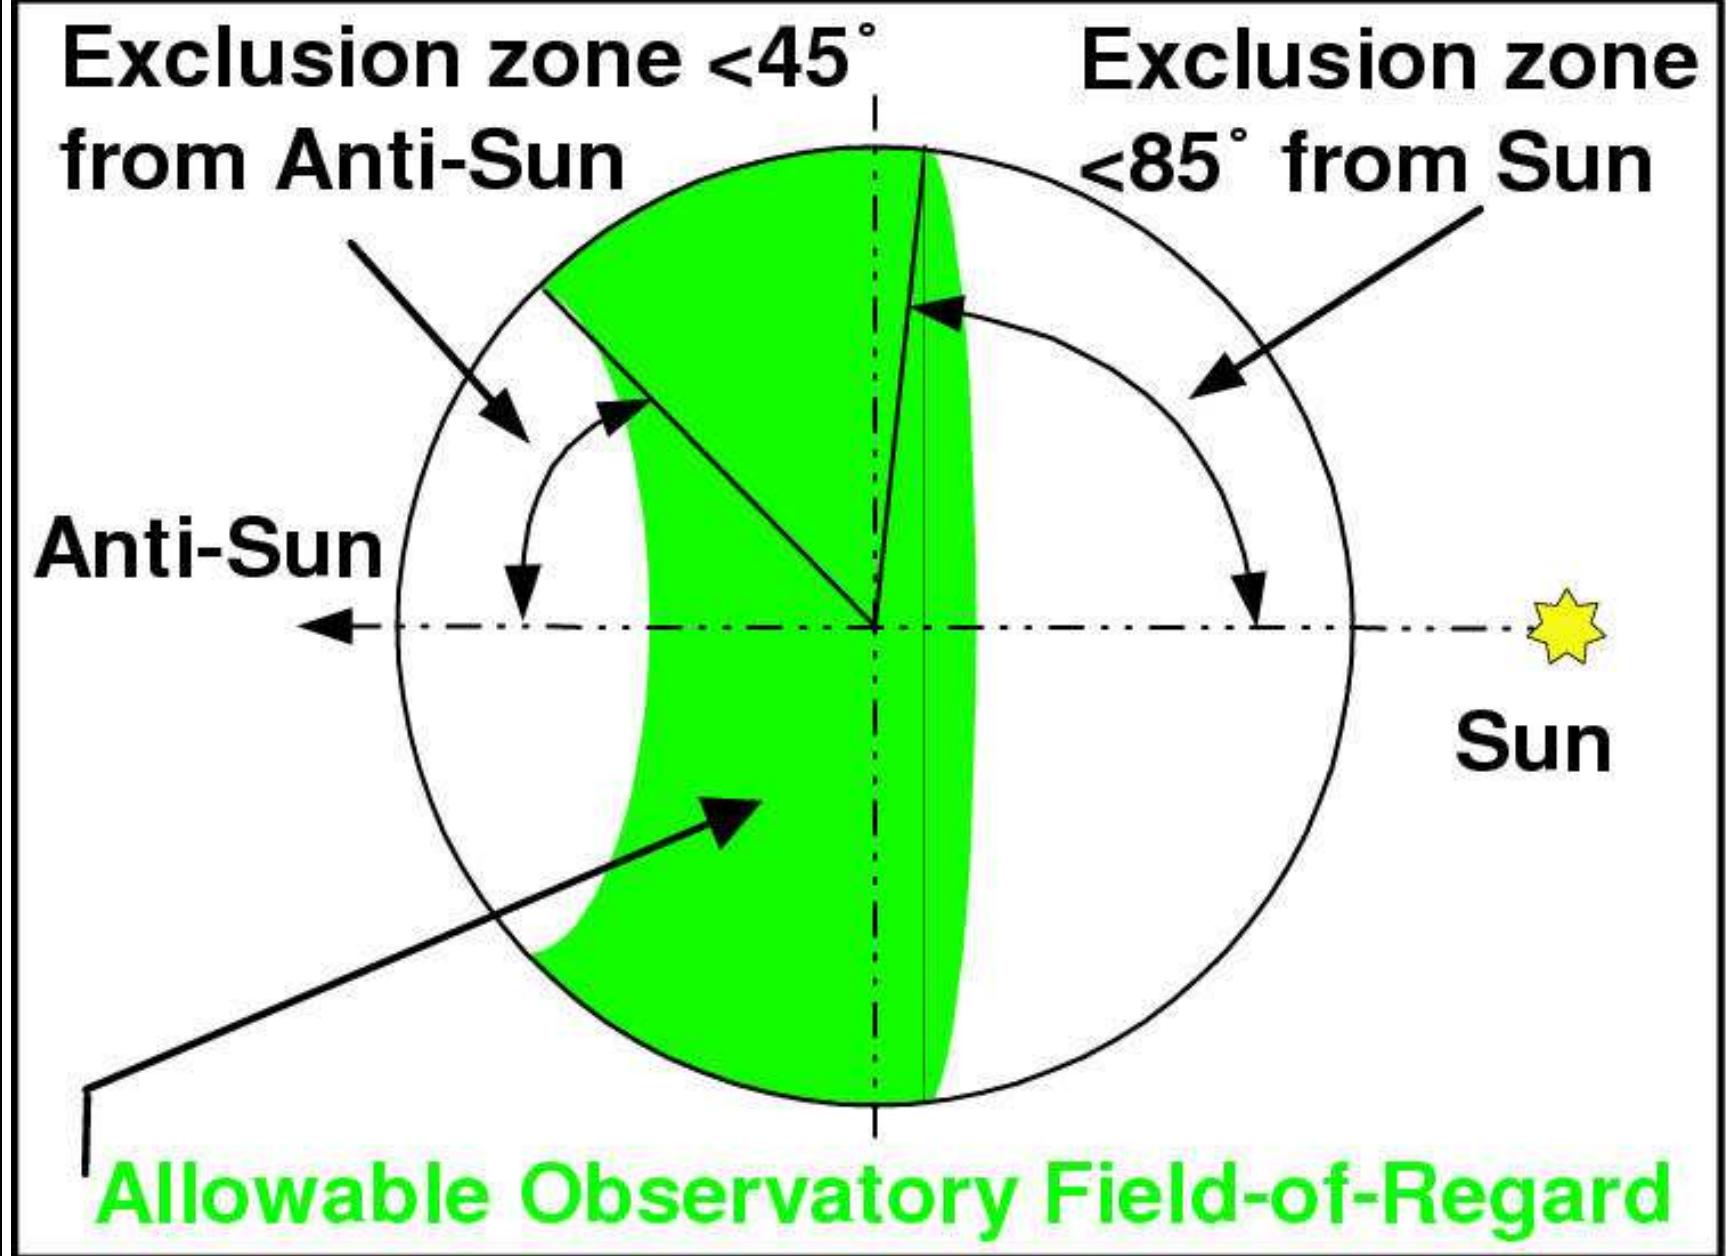

JWST's Wave Front Sensing and Control is similar to the Keck telescope.

In L2, need WFS updates every 10 days depending on scheduling/illumination.

Wave-Front Sensing tested hands-off at 40 K in 1-G at JSC in 2015-2016.

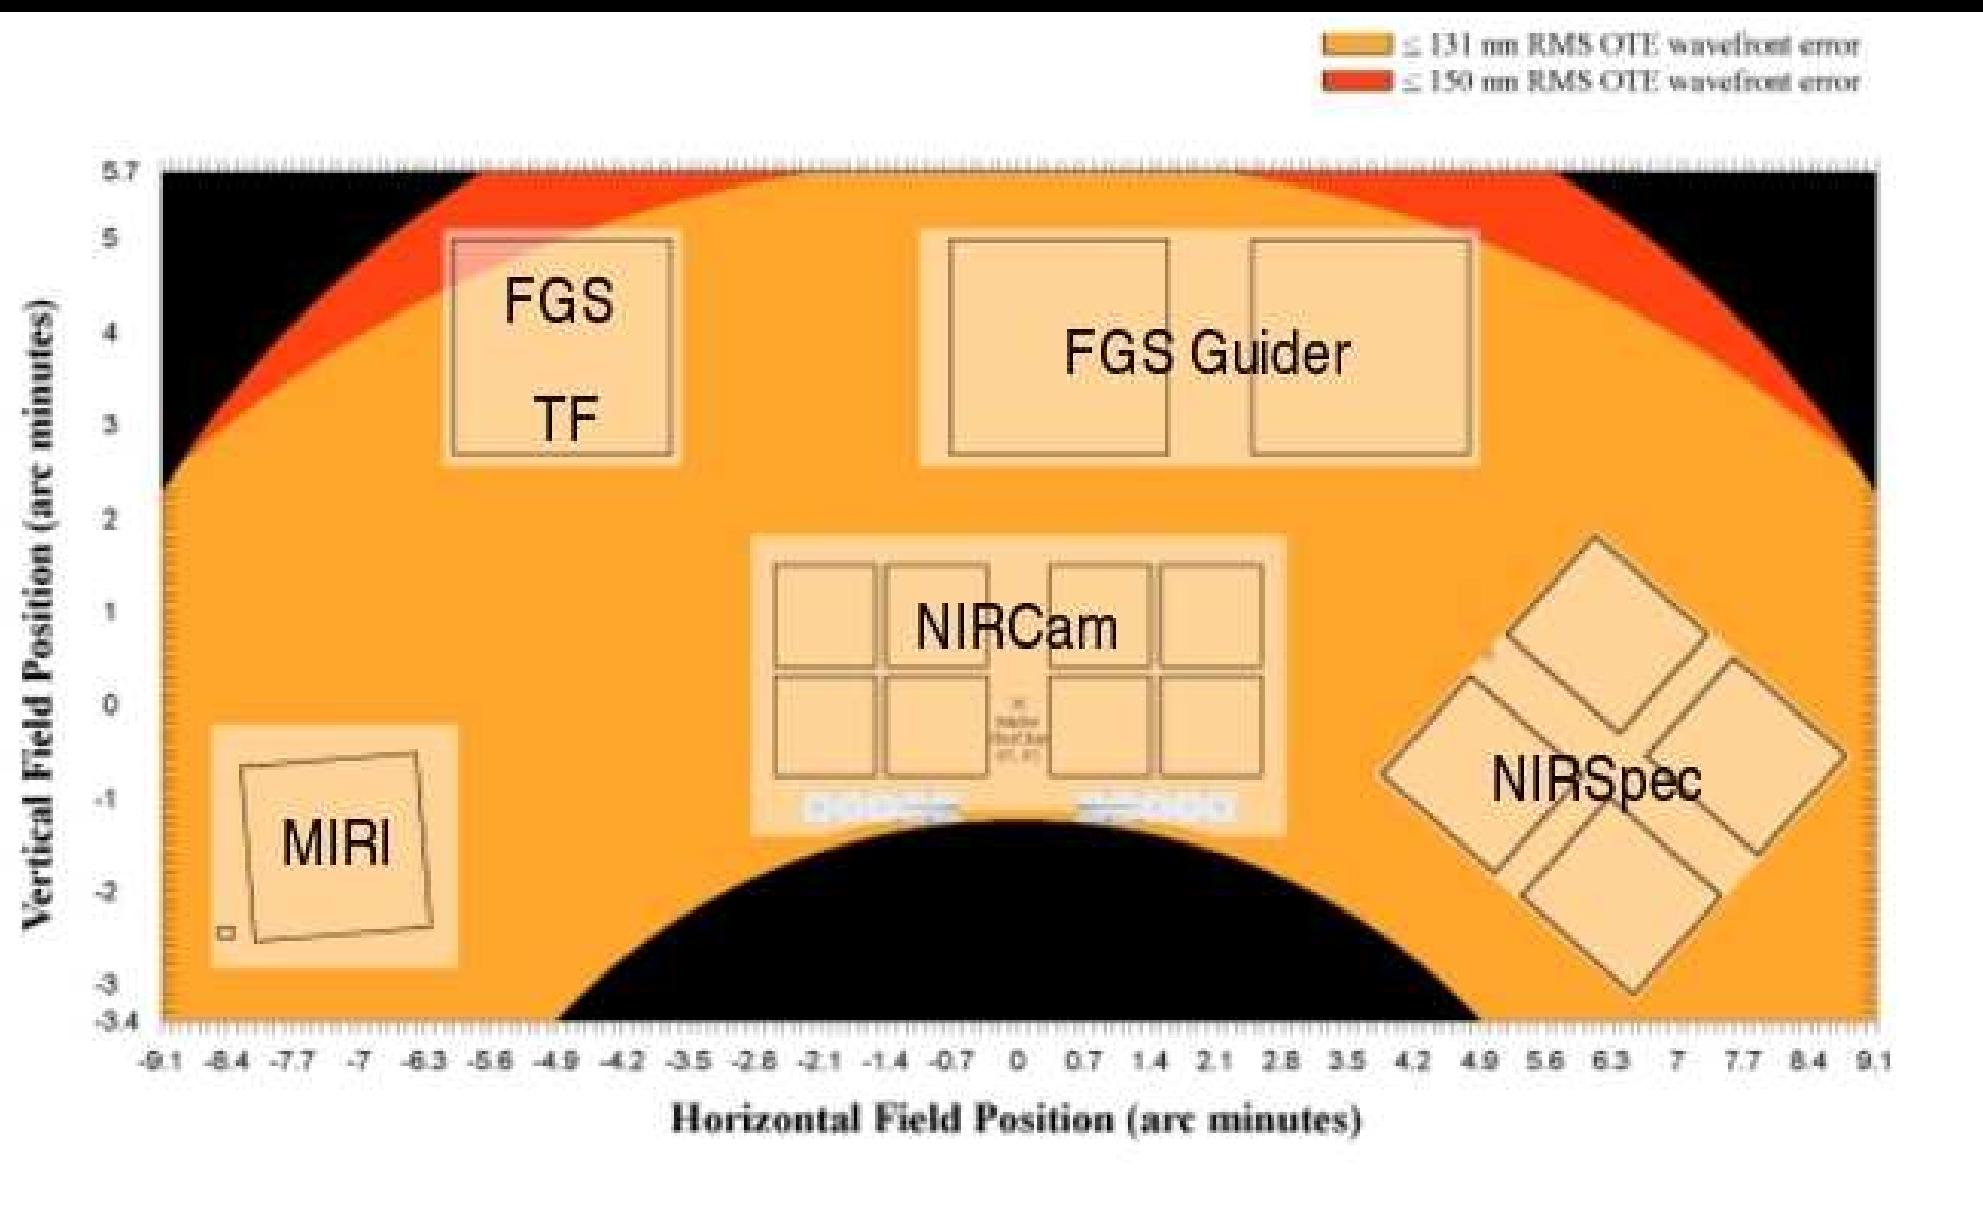

Ball 1/6 scale-model for WFS: produces diffraction-limited 2.0 μm images.

JWST can observe North/South Ecliptic pole targets continuously:

- 1000-hr JWST projects swap back/forth between NEP/SEP targets.
- They will rely a lot on Rockwell Collins' (Heidelberg) reaction wheels.

- (3c) What instruments will JWST have?

- All JWST instruments can in principle be used in parallel observing mode:
- Currently only being implemented for parallel *calibrations*.

Ultraviolet Galaxies

NASA and R. Windhorst (Arizona State University) • STScI-PRC01-04

HST • WFPC2

- The rest-frame UV-morphology of galaxies is dominated by young and hot stars, with often significant dust imprinted (Mager-Taylor et al. 2005).
- High-resolution HST ultraviolet images are benchmarks for comparison with very high redshift galaxies seen by JWST.

B, I, J AB-mag vs.
half-light radii r_e
from RC3 to HUDF
limit are shown.

All surveys limited by
by SB (+5 mag dash)

Deep surveys bounded
also by object density.

Violet lines are gxy
counts converted to
to natural conf limits.

Natural confusion
sets in for faintest
surveys ($AB \gtrsim 25$).
Will update for JWST.
