

# The World of Webb, the Cosmic Circle of Life, and seeing through the Eyes of Einstein

Rogier Windhorst (ASU) — JWST Interdisciplinary Scientist

+JWST PEARLS team: T. Carleton, S. Cohen, R. Jansen, P. Kamieneski, T. Acharya, H. Archer, J. Berkheimer, D. Carter, N. Foo, R. Honor, D. Kramer, T. McCabe, I. McIntyre, R. O'Brien, R. Ortiz, J. Summers, S. Tompkins, C. Conselice, J. Diego, S. Driver, J. D'Silva, B. Frye, H. Yan, D. Coe, N. Grogin, W. Keel, A. Koekemoer, M. Marshall, N. Pirzkal, A. Robotham, R. Ryan Jr., C. Willmer + 110 more scientists over 18 time-zones

*Colloquium at the Department of Astronomy, University of Illinois Urbana-Champaign, Urbana, IL*

*Tuesday November 11, 2025. All presented materials are ITAR-cleared. [FOV~Dist/1000].*

# Outline

---

- (1) Webb in orbit as of 2021
- (2) Webb's first images: the "Cosmic Circle of Life"
- (3) Viewing the Universe through the "Eyes of Einstein"
- (4) Summary and Conclusions

## SPARE CHARTS:

- (5) Spare Science Charts
- (6) Uniquely complementary roles of Hubble and Webb

Sponsored by NASA/HST & JWST

Talk is on: [http://lambda.la.asu.edu/raw/jwst/talks/uiuc25\\_jwst\\_v3.pdf](http://lambda.la.asu.edu/raw/jwst/talks/uiuc25_jwst_v3.pdf)

WARNING: asking NASA for Hubble images is like drinking from a fire-hydrant;

WARNING: asking NASA for Hubble images is like drinking from a fire-hydrant;

asking NASA for Webb images is like taking a sip from Niagara Falls!

Children: Please don't do this at home!! :)

Webb is finally launched from Kourou on December 25, 2021!

Dec. 25, 2021: Webb seen shortly after launch over Africa using the Ariane V on-board camera.

PRIMARY MIRROR SELFIE

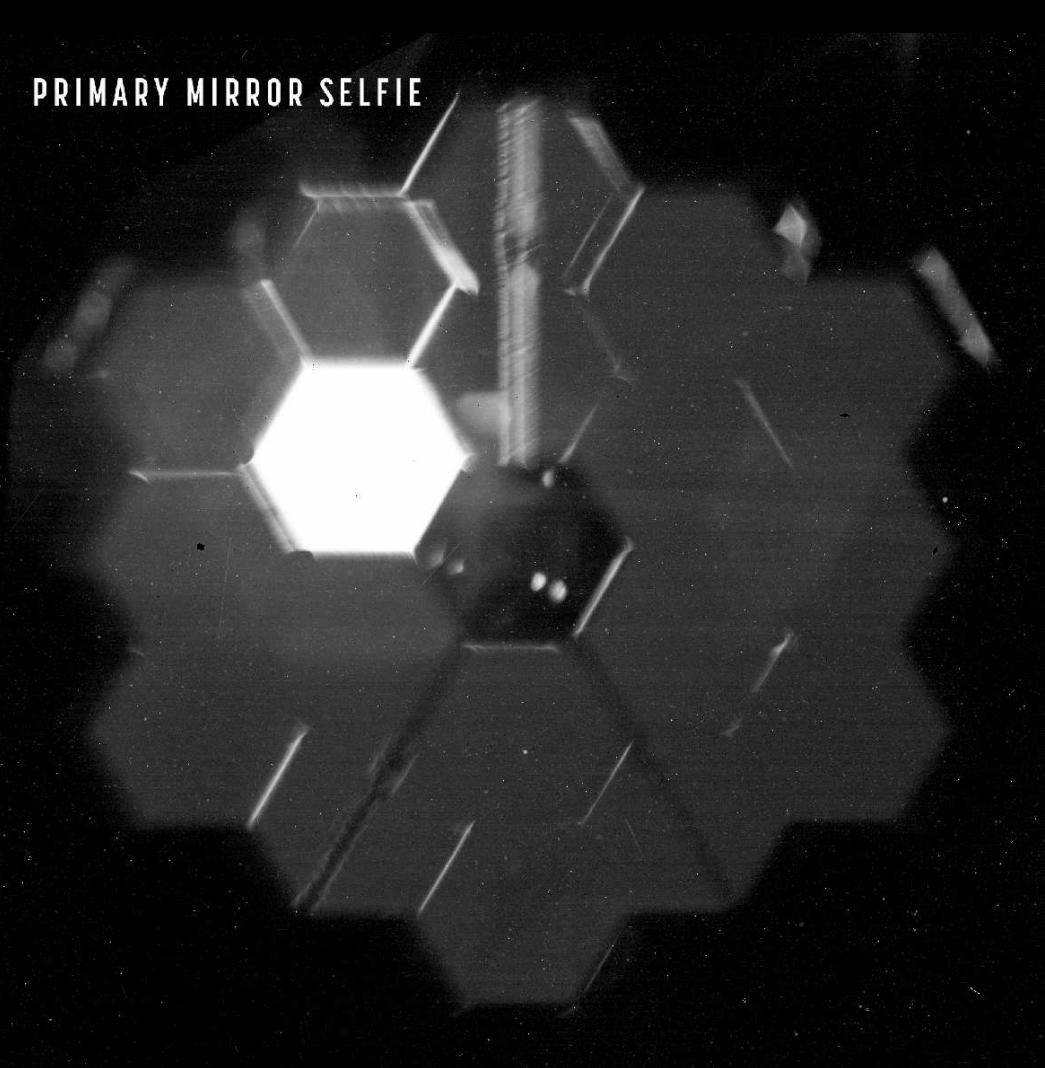

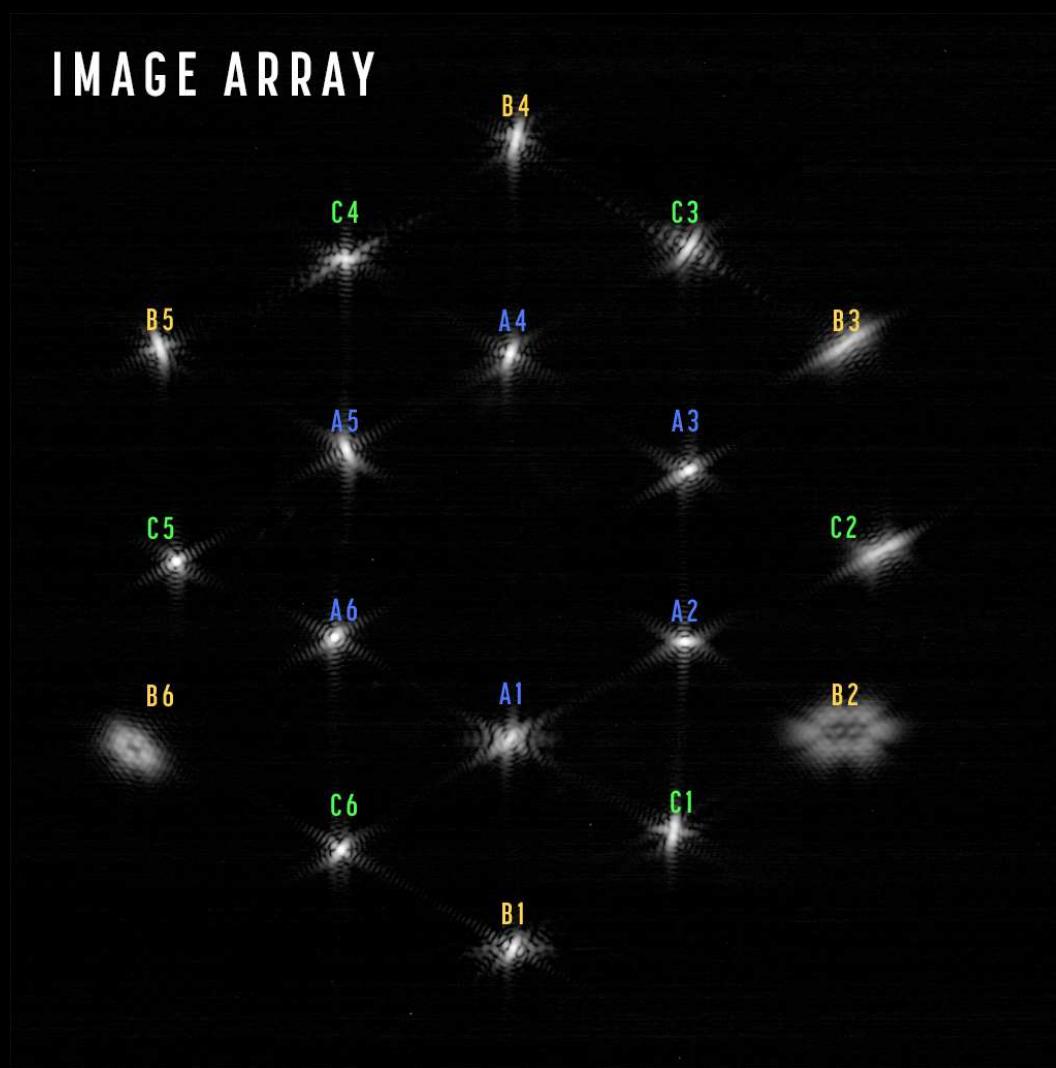

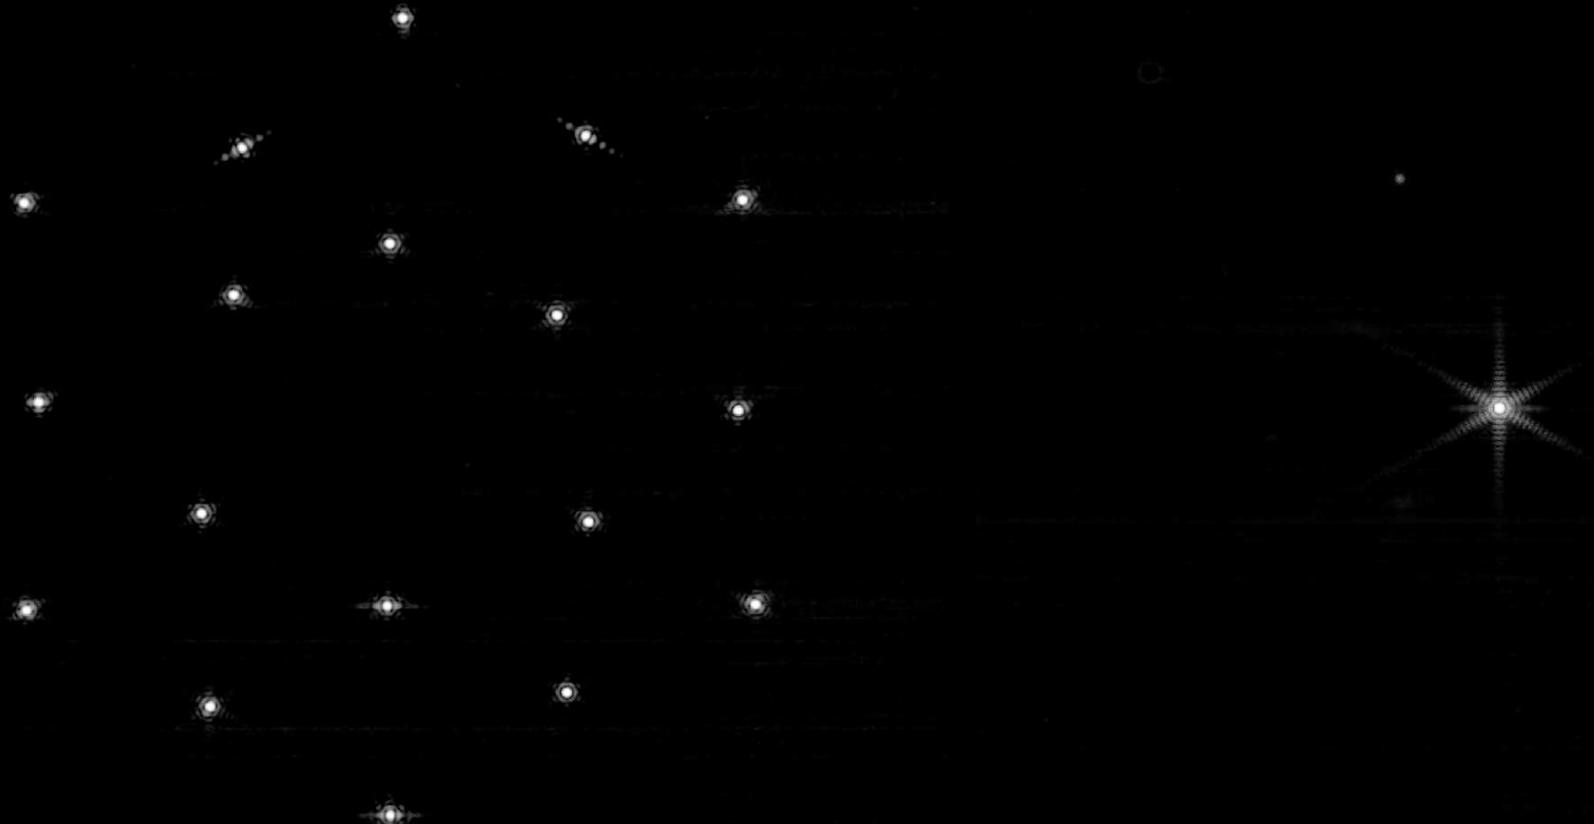

IMAGE ARRAY

Feb. 2022: Webb's first selfie (left) and First Light raw image (right).

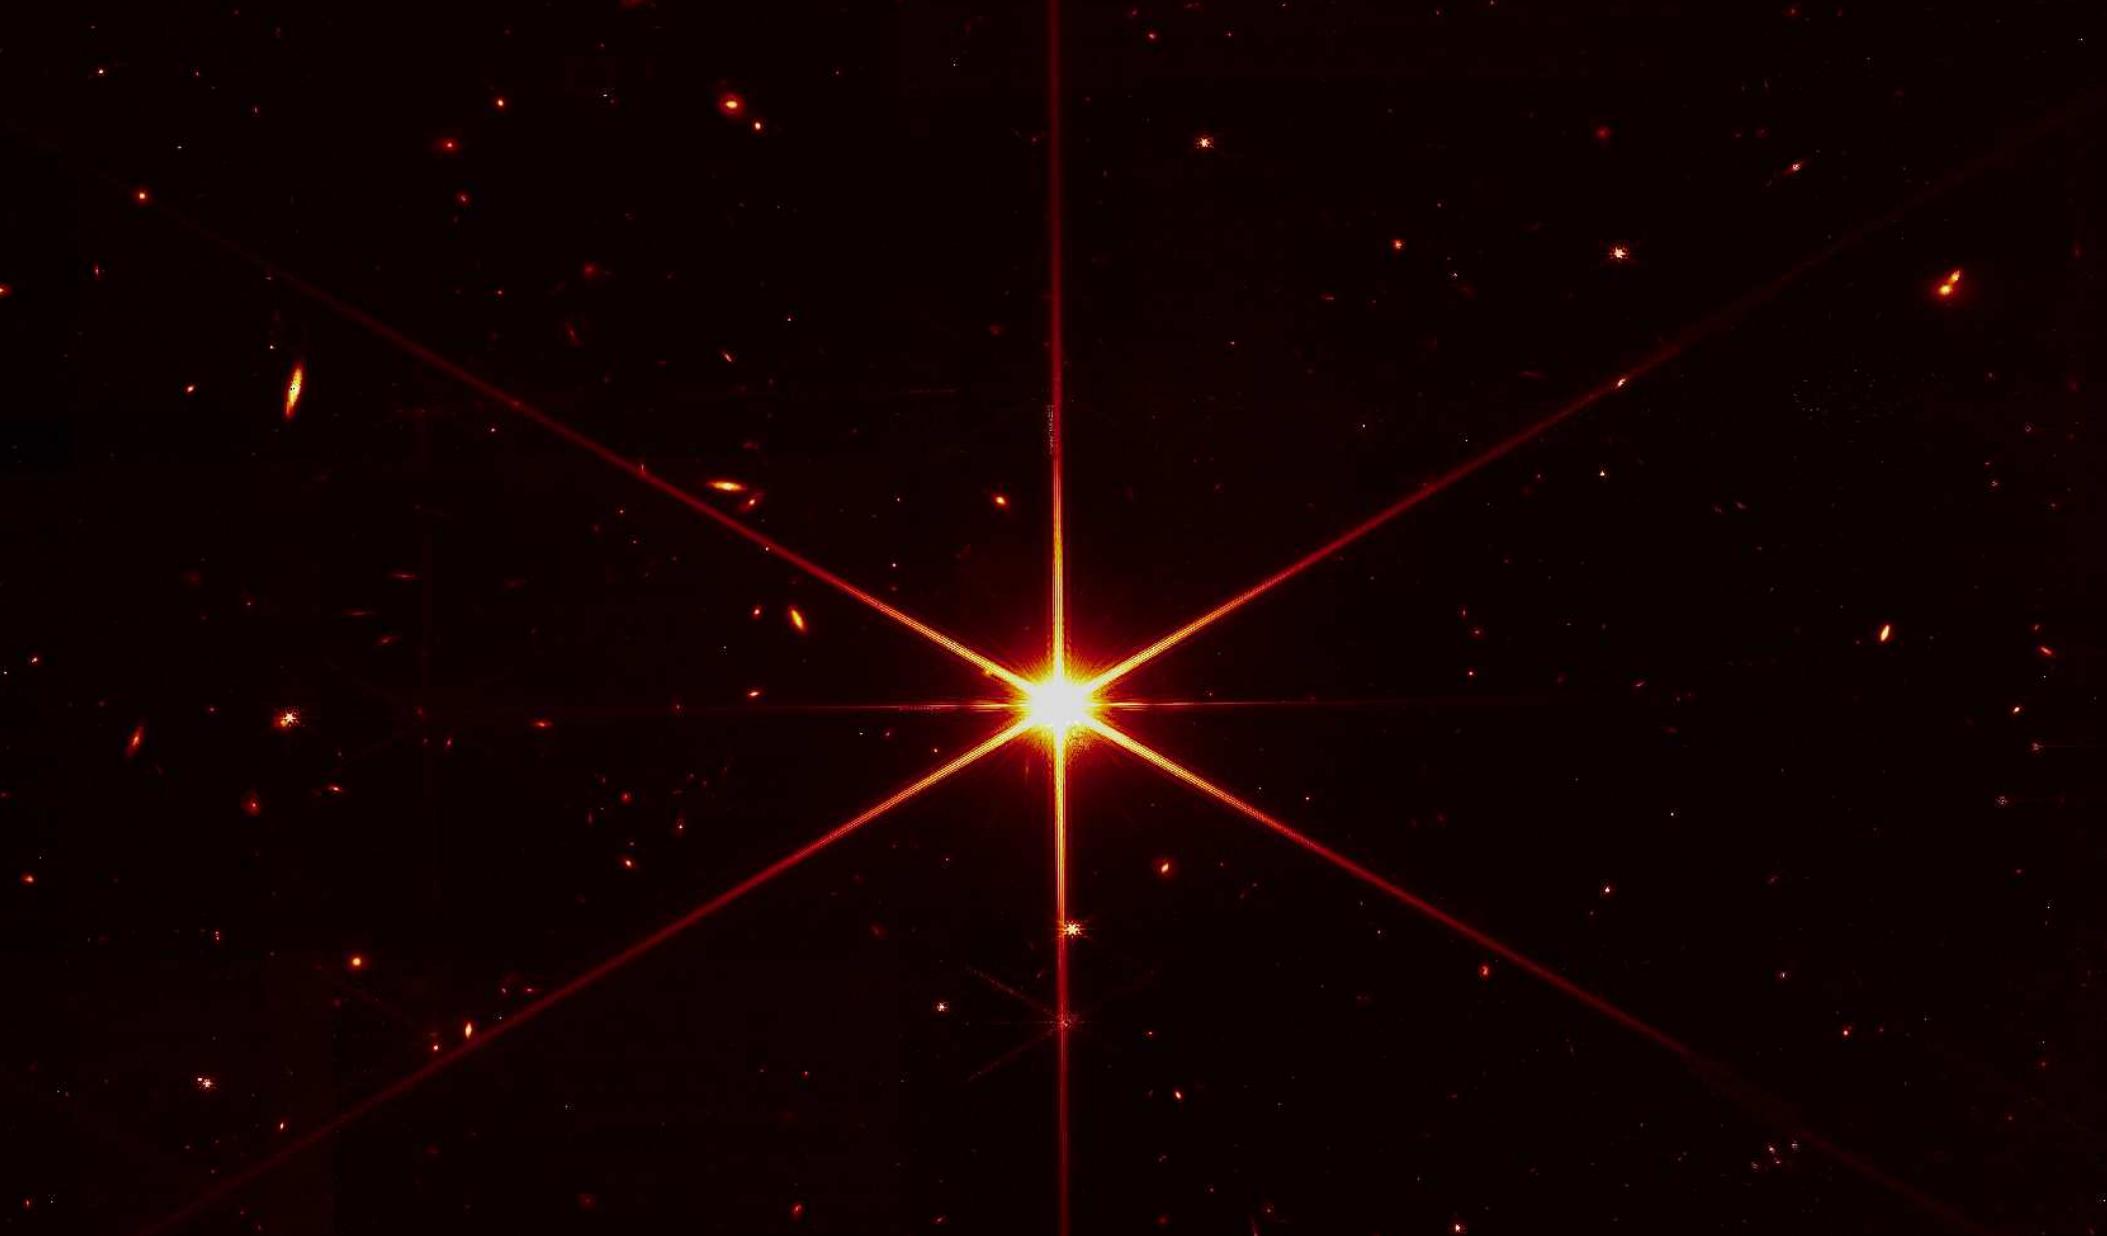

COMPLETED SEGMENT ALIGNMENT

COMPLETED IMAGE STACKING

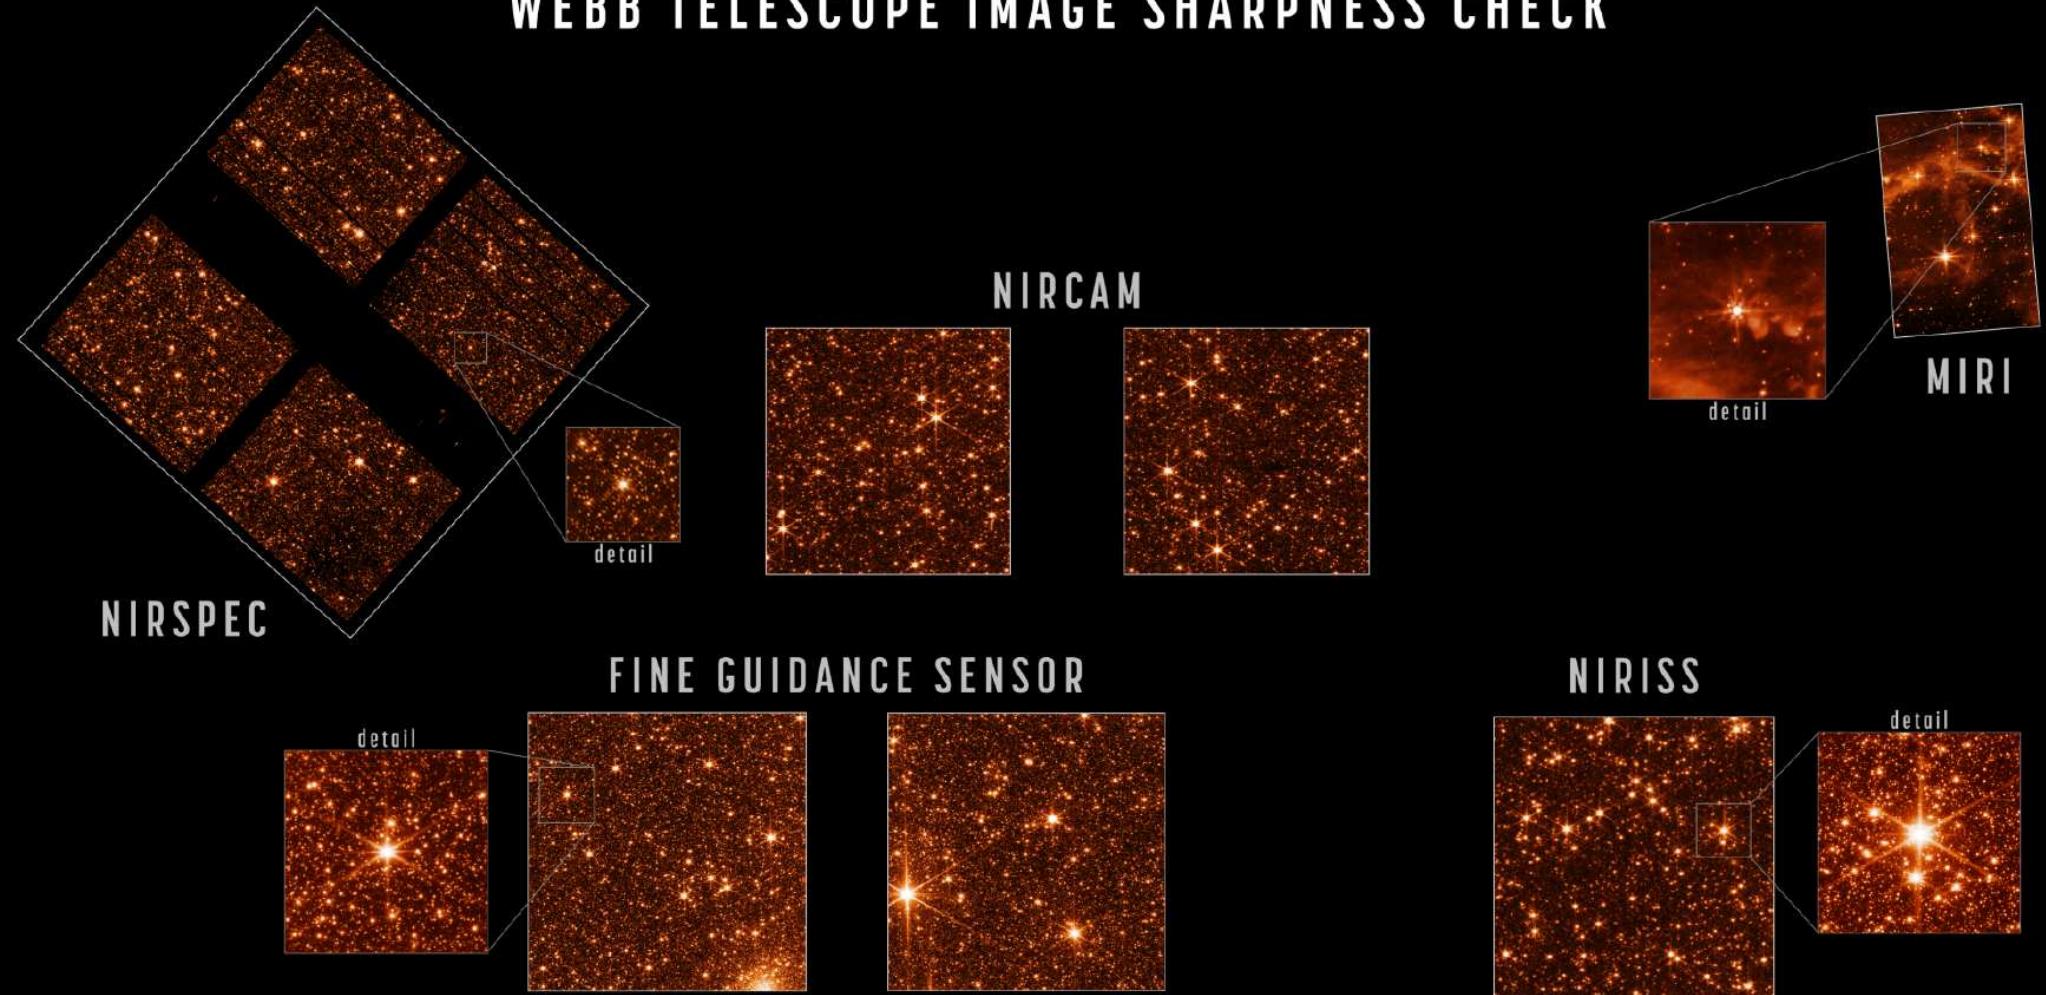

Webb's first segment alignment (left) and first image stack (right).

# TELESCOPE ALIGNMENT EVALUATION IMAGE

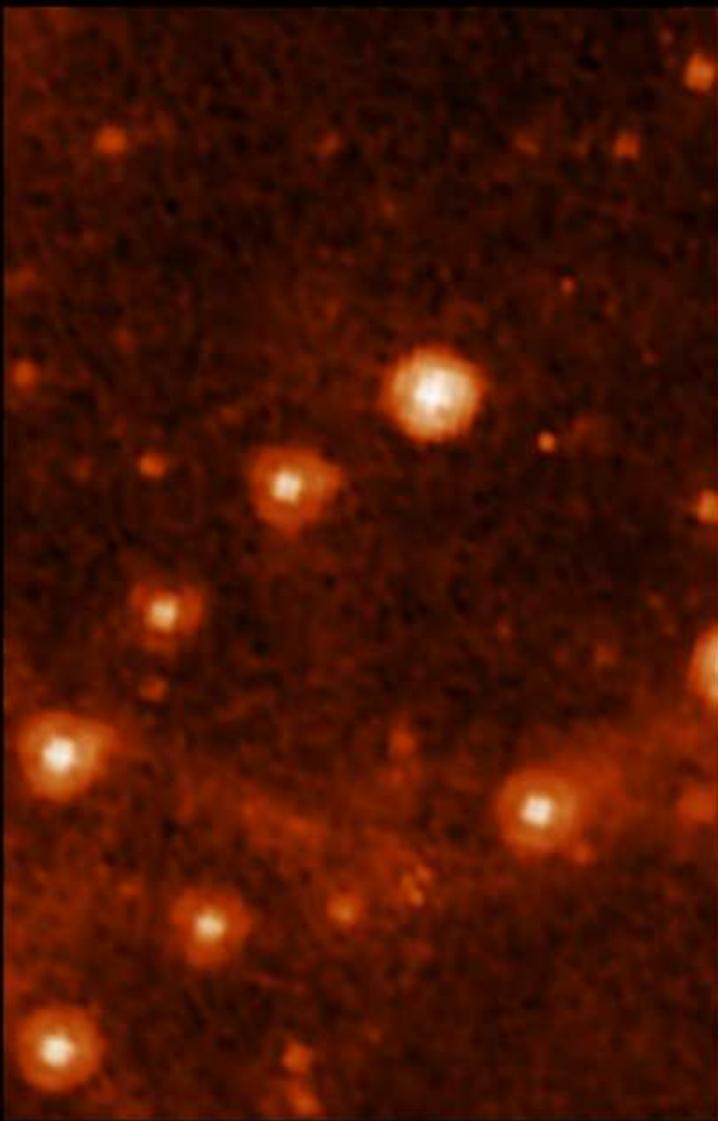

March 16, 2022: Webb's first fully focused image publicly released !!  
Note the plethora of faint galaxies — Webb's looking back in time!

# WEBB TELESCOPE IMAGE SHARPNESS CHECK

April 28, 2022: Webb's first fully focused images in all four instruments:  
A dense star field in the Large Magellanic Cloud in the South Ecliptic Pole!  
(NIRSpec:  $1.1 \mu\text{m}$ ; NIRISS:  $1.5 \mu\text{m}$ ; NIRCam:  $2.0 \mu\text{m}$ ; MIRI  $7.7 \mu\text{m}$ ).

SPITZER IRAC  $8.0 \mu$

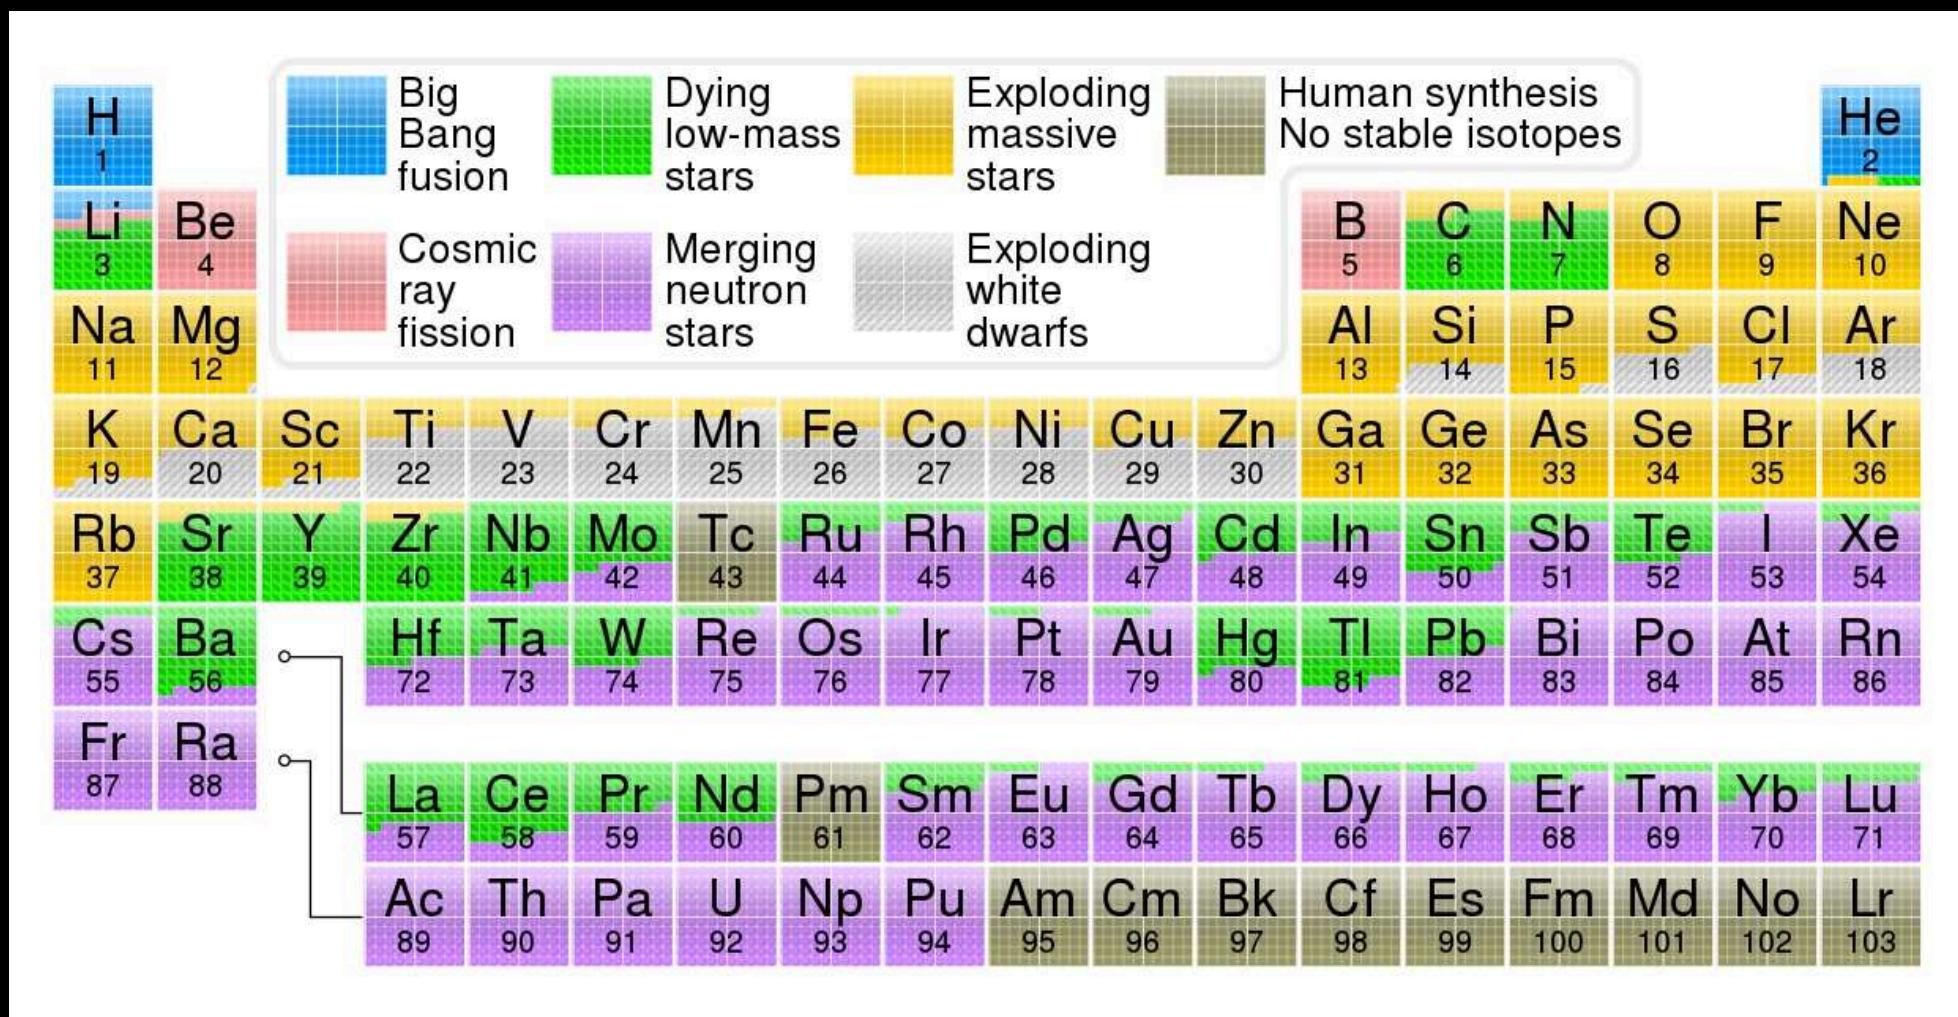

WEBB MIRI  $7.7 \mu$

May 9, 2022: Webb's  $7.7 \mu$ m MIRI image compared to Spitzer  $8.0 \mu$ m:  
Same dense star field in the Large Magellanic Cloud in the South Ecliptic Pole

Before we get to the cosmic circle of life, let's get this straight:

- This Periodic Table you learned in highschool is **NOT** the real one!:

(1) Hydrogen & Helium: the *only* chemical elements made in the Big Bang!

(2) All heavier elements made by (dying) stars:

- Low mass stars ejecting their outer shells;
- Supernova explosions/WD's; &
- neutron star mergers.

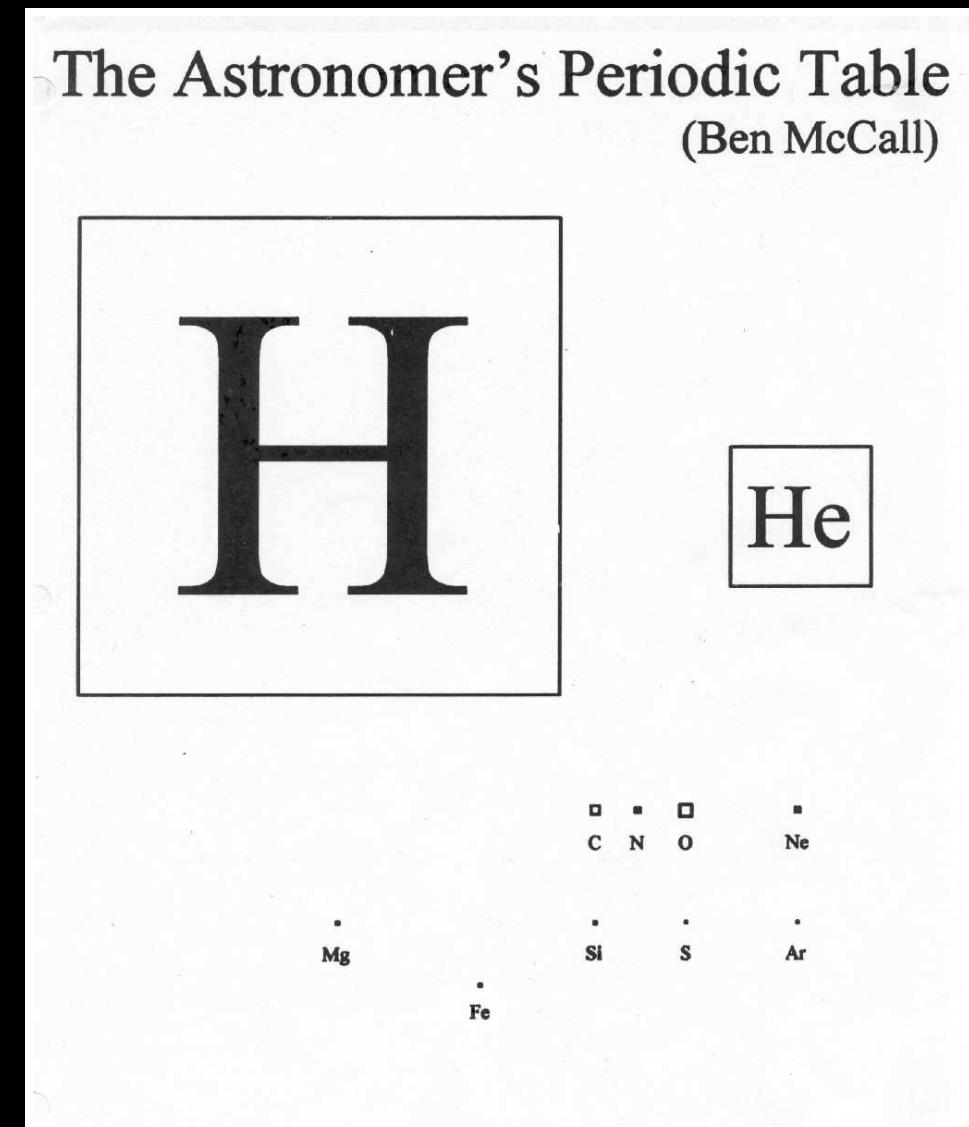

## Here is the correct Astronomical Periodic Table:

(1) Hydrogen (76%) & Helium (24%) are the only chemical elements made in the Big Bang.

(2) Heavier chemical elements ( $\lesssim 1\%$ ; "dust") made by (dying) stars:

- Late stages of stellar evolution, Supernova explosions & white dwarfs, and neutron star mergers distribute these throughout the universe.

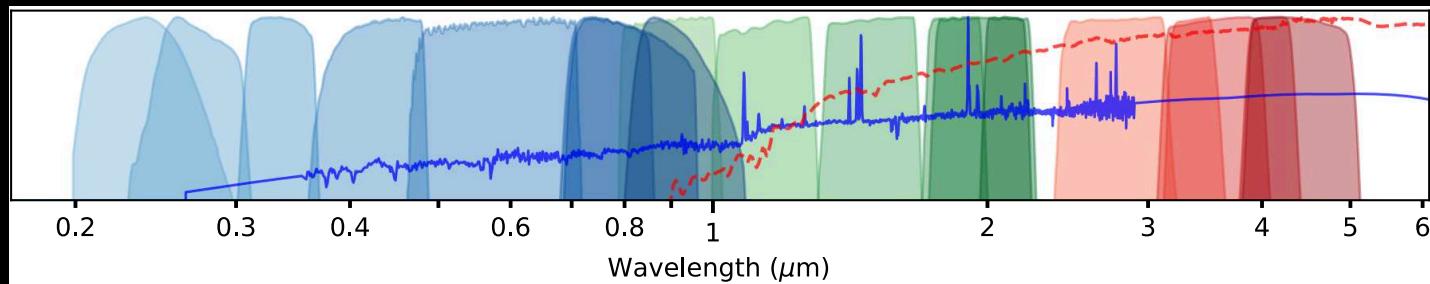

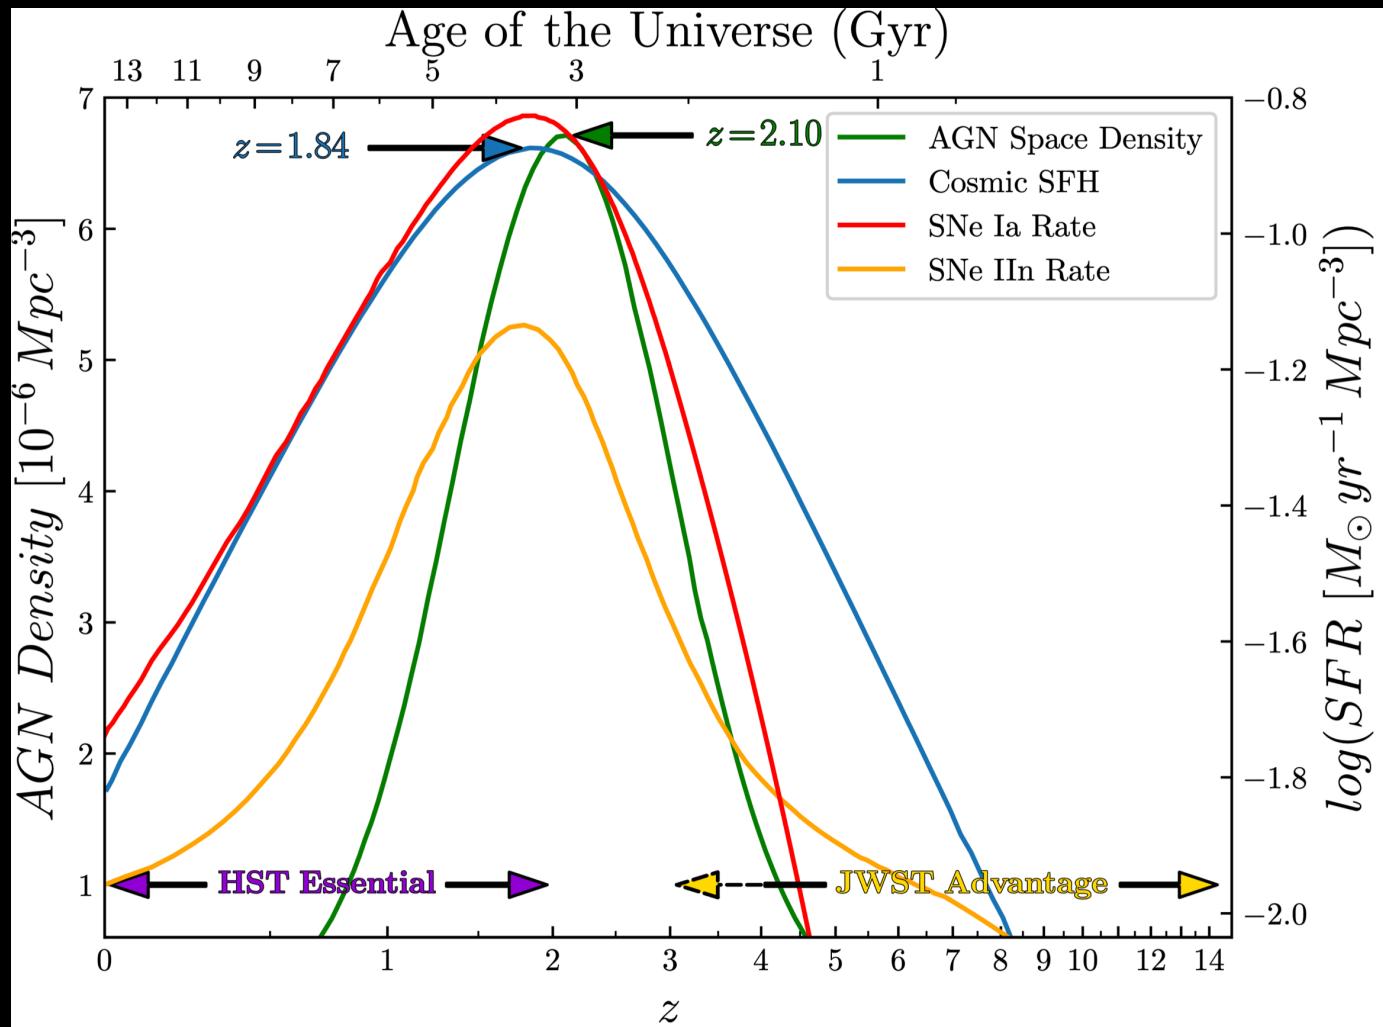

⇒ Planets and people are literally made from stardust!

- This is the real Periodic Table with cosmic abundance included.
- This has significant consequences for Hubble and Webb complementarity!

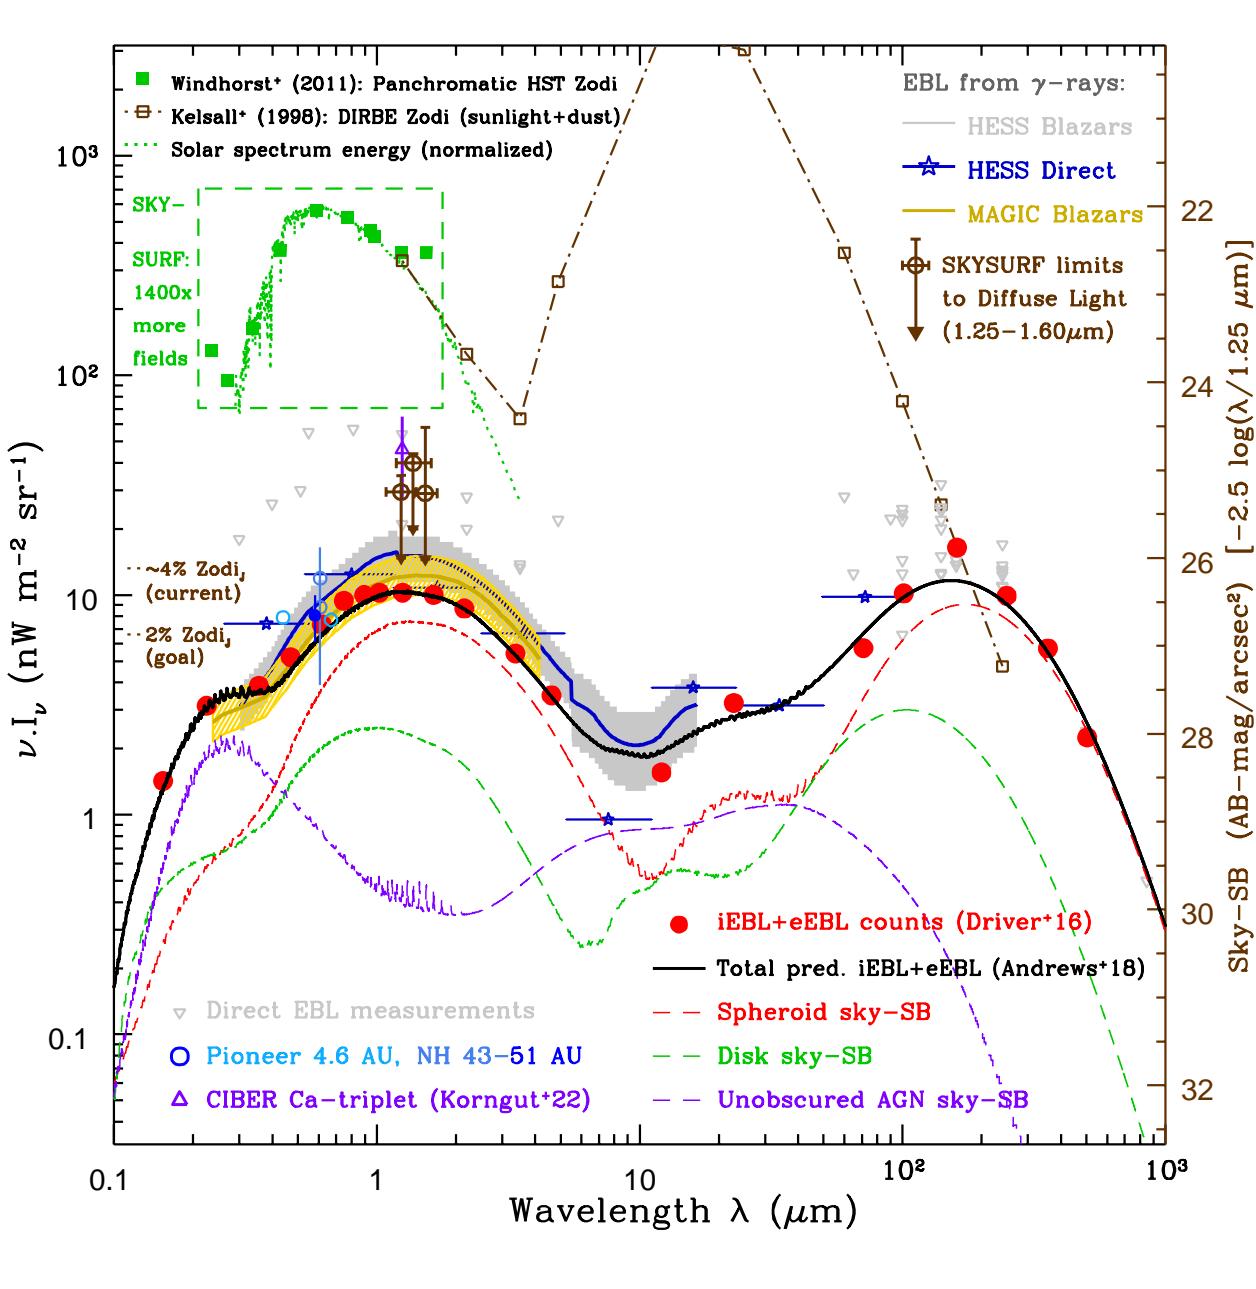

# Star Formation, Supernova Rate, & Black Hole growth peak $\sim$ 10 Gyr ago!

Windhorst et al.  
astro-ph/2410.01187

$\Rightarrow$ HST best samples *unobscured* SFH & BH growth in last 10 Gyr ( $z \lesssim 2$ ),  
while JWST best samples *obscured* parts, especially in first 3 Gyr ( $z \gtrsim 3$ ).

# Fly's-eye energy in Universe vs. $\lambda$ : (Driver<sup>+</sup> 2016; Windhorst<sup>+</sup> 2018, 2022):

Sunlight scattered off the Zodiacal dust.

Thermal radiation from  $\gtrsim 240$  K Zodiacal dust.

- integrated light from galaxy counts (+models).

New Horizon diffuse light  
(Lauer<sup>+</sup> 2021, 2022; 43–51 AU).

SKYSURF 1.25–1.6  $\mu\text{m}$   
diffuse light (Carleton<sup>+</sup> 2022;  
O'Brien<sup>+</sup> 2023, 2025; McIntyre<sup>+</sup> 2024).

- Energy(cosmic SF+AGN)  $\simeq 48\%$ ; Energy(dust)  $\simeq 52\% \Rightarrow$  Dust wins !
- $\Rightarrow 1\%$  of the baryons (“dust”) produce  $\sim 52\%$  of Energy (except CMB)!

- (2) Webb's first images: the “Cosmic Circle of Life”

Hubble WFPC2 Eagle Nebula (1995) compared to JWST NIRCam (2022):

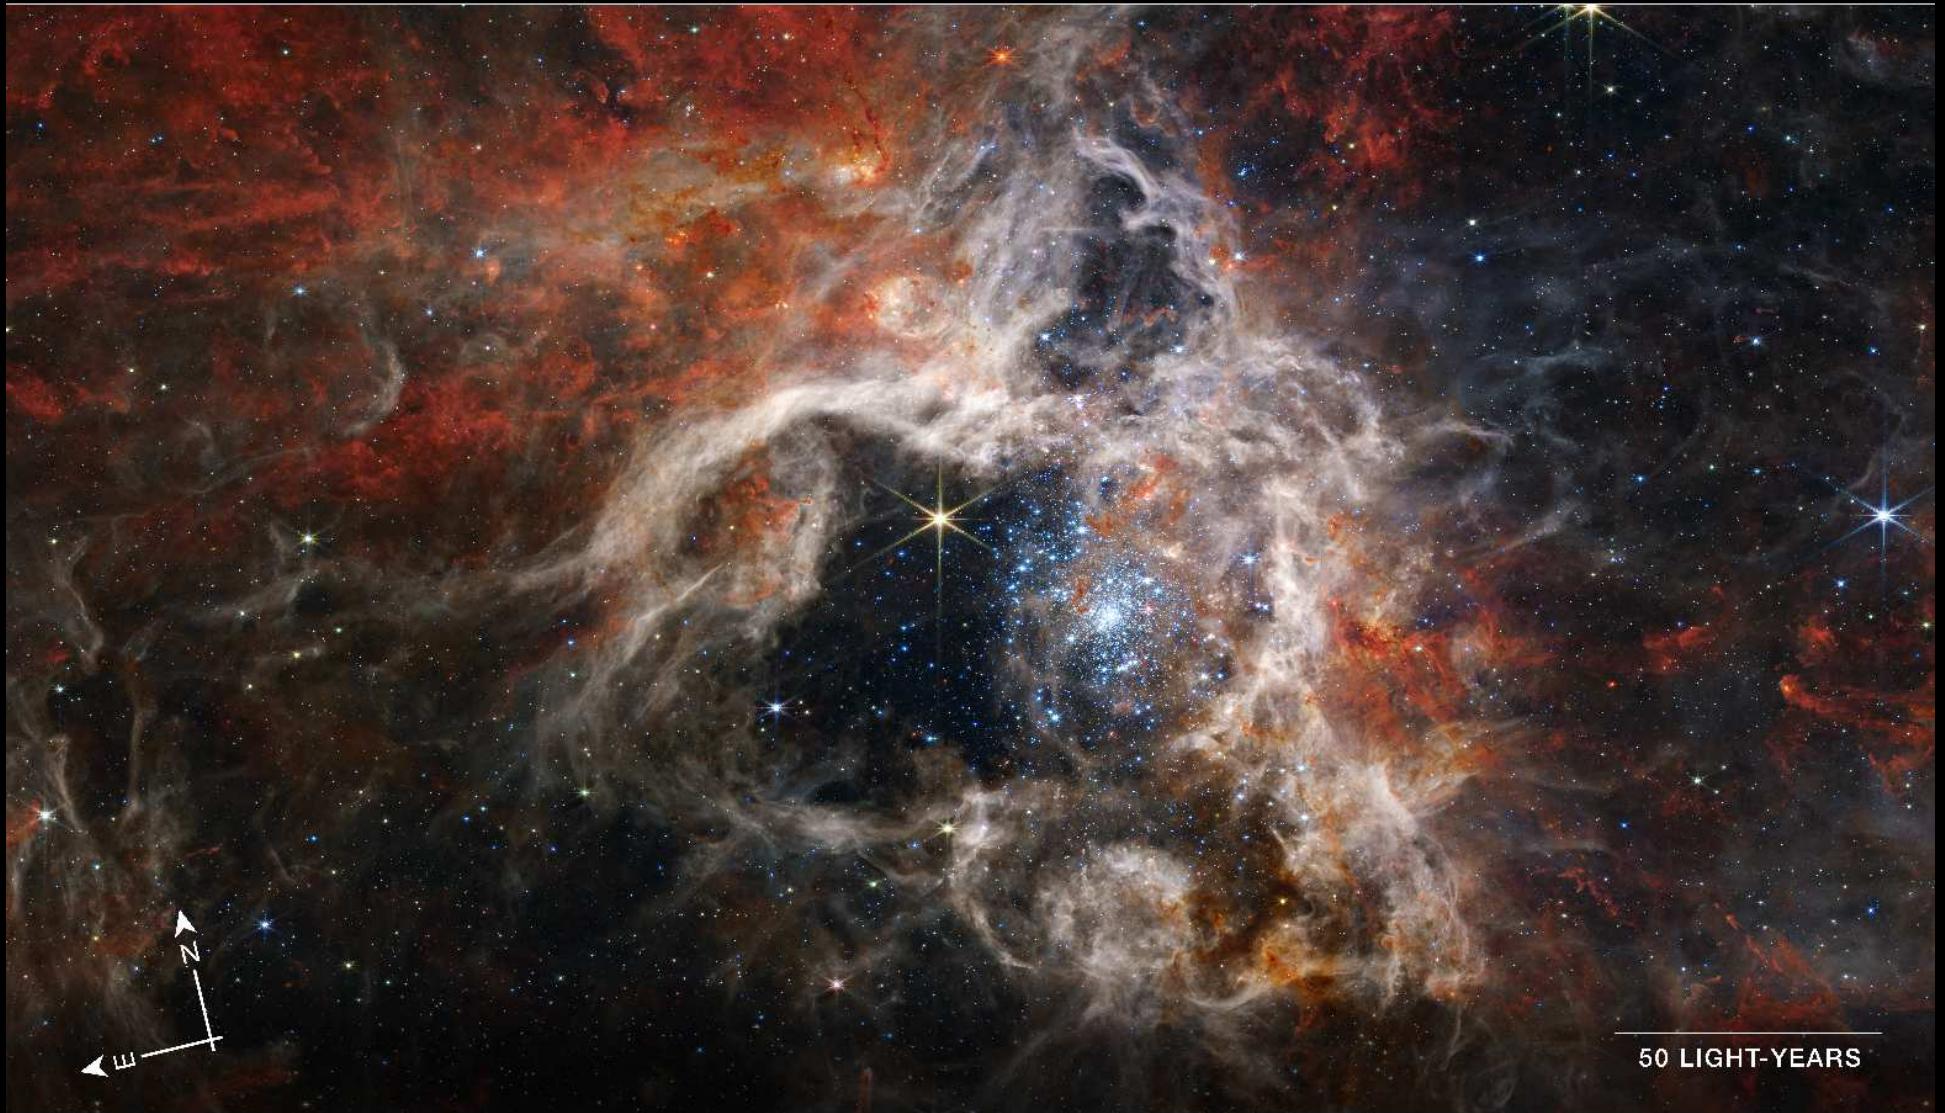

- The cradle of cosmic star-formation: NIRCam peers through the dust!
- The 1995 Hubble WFPC2 image (left) was made by Prof. Jeff Hester and Paul Scowen at ASU. It made it onto a US postage stamp!

Webb's MIRI shows the hauntingly beautiful cosmic dust pillars (8–15  $\mu\text{m}$ )

# TARANTULA NEBULA | NGC 2070

NIRCam Filters

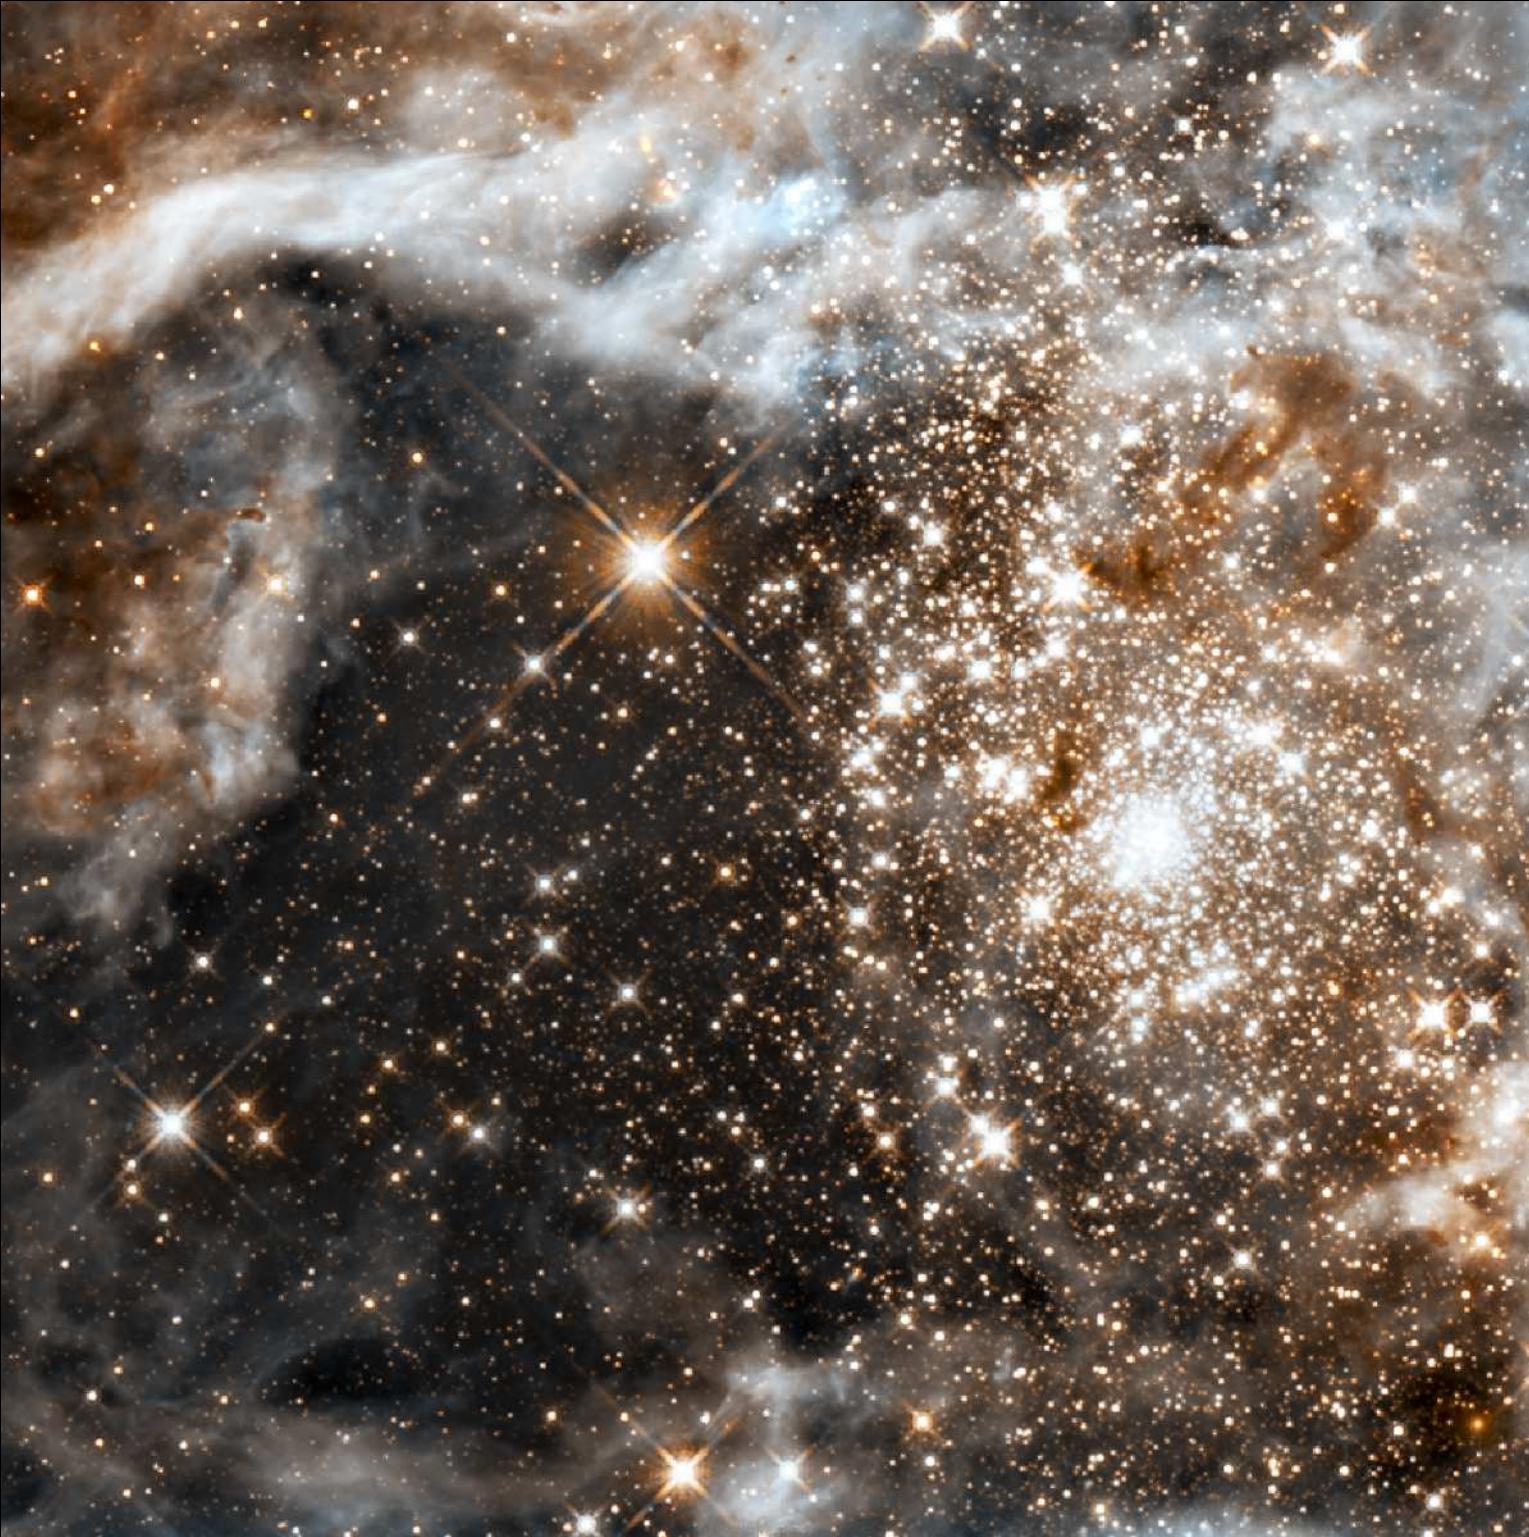

F090W F200W F335M F444W

50 LIGHT-YEARS

Tarantula Nebula “30 Doradus” in Large Magellanic Cloud (163,000 lyrs away)  
Cradle of cosmic star-formation: massive stars trigger formation of sun-like stars

HST Wide Field Camera 3 UV-optical image of 30 Dor: hot massive stars.

HST WFC3 near-IR image of 30-Dor: massive and low-mass stars.

“Cosmic Cliffs” of star-formation in the Carina Nebula (NIR; 7600 light-years).

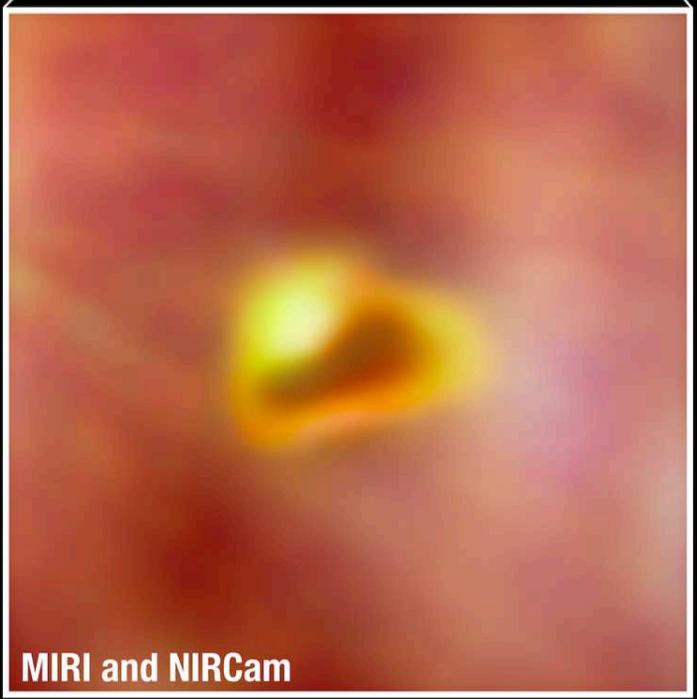

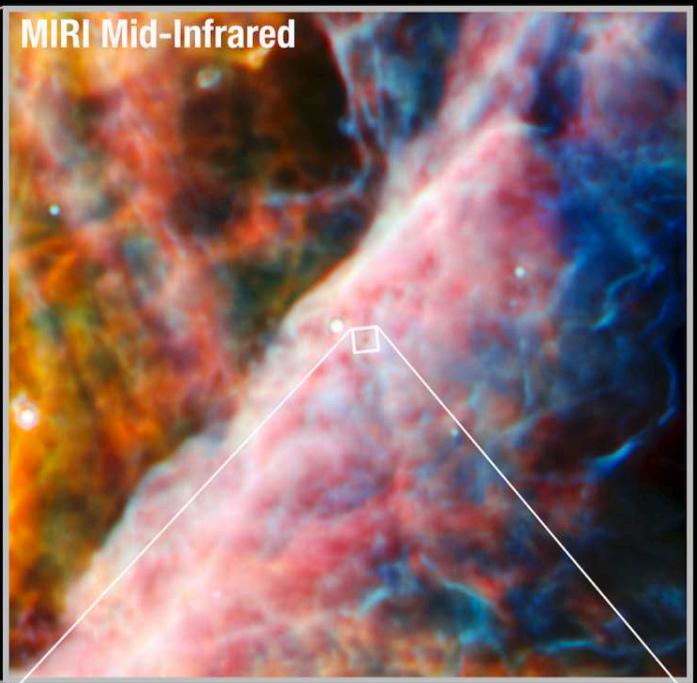

You will be witnessing the “Cosmic Circle of Life” ...

Cosmic Cliffs of Star-formation in Carina Nebula (NIR+MIR).

Compared to optical+near-IR, mid-IR sees “Cradle of Cosmic Star-formation”

Deep inside the gas and dust, mid-IR reveals birth of young Sun-like stars.

JWST NIRCam+MIRI: Cosmic Cliff-like in Orion's Trapezium (1344 lyrs):

- New stars are forming containing the carbon chain “Methyl Cation”

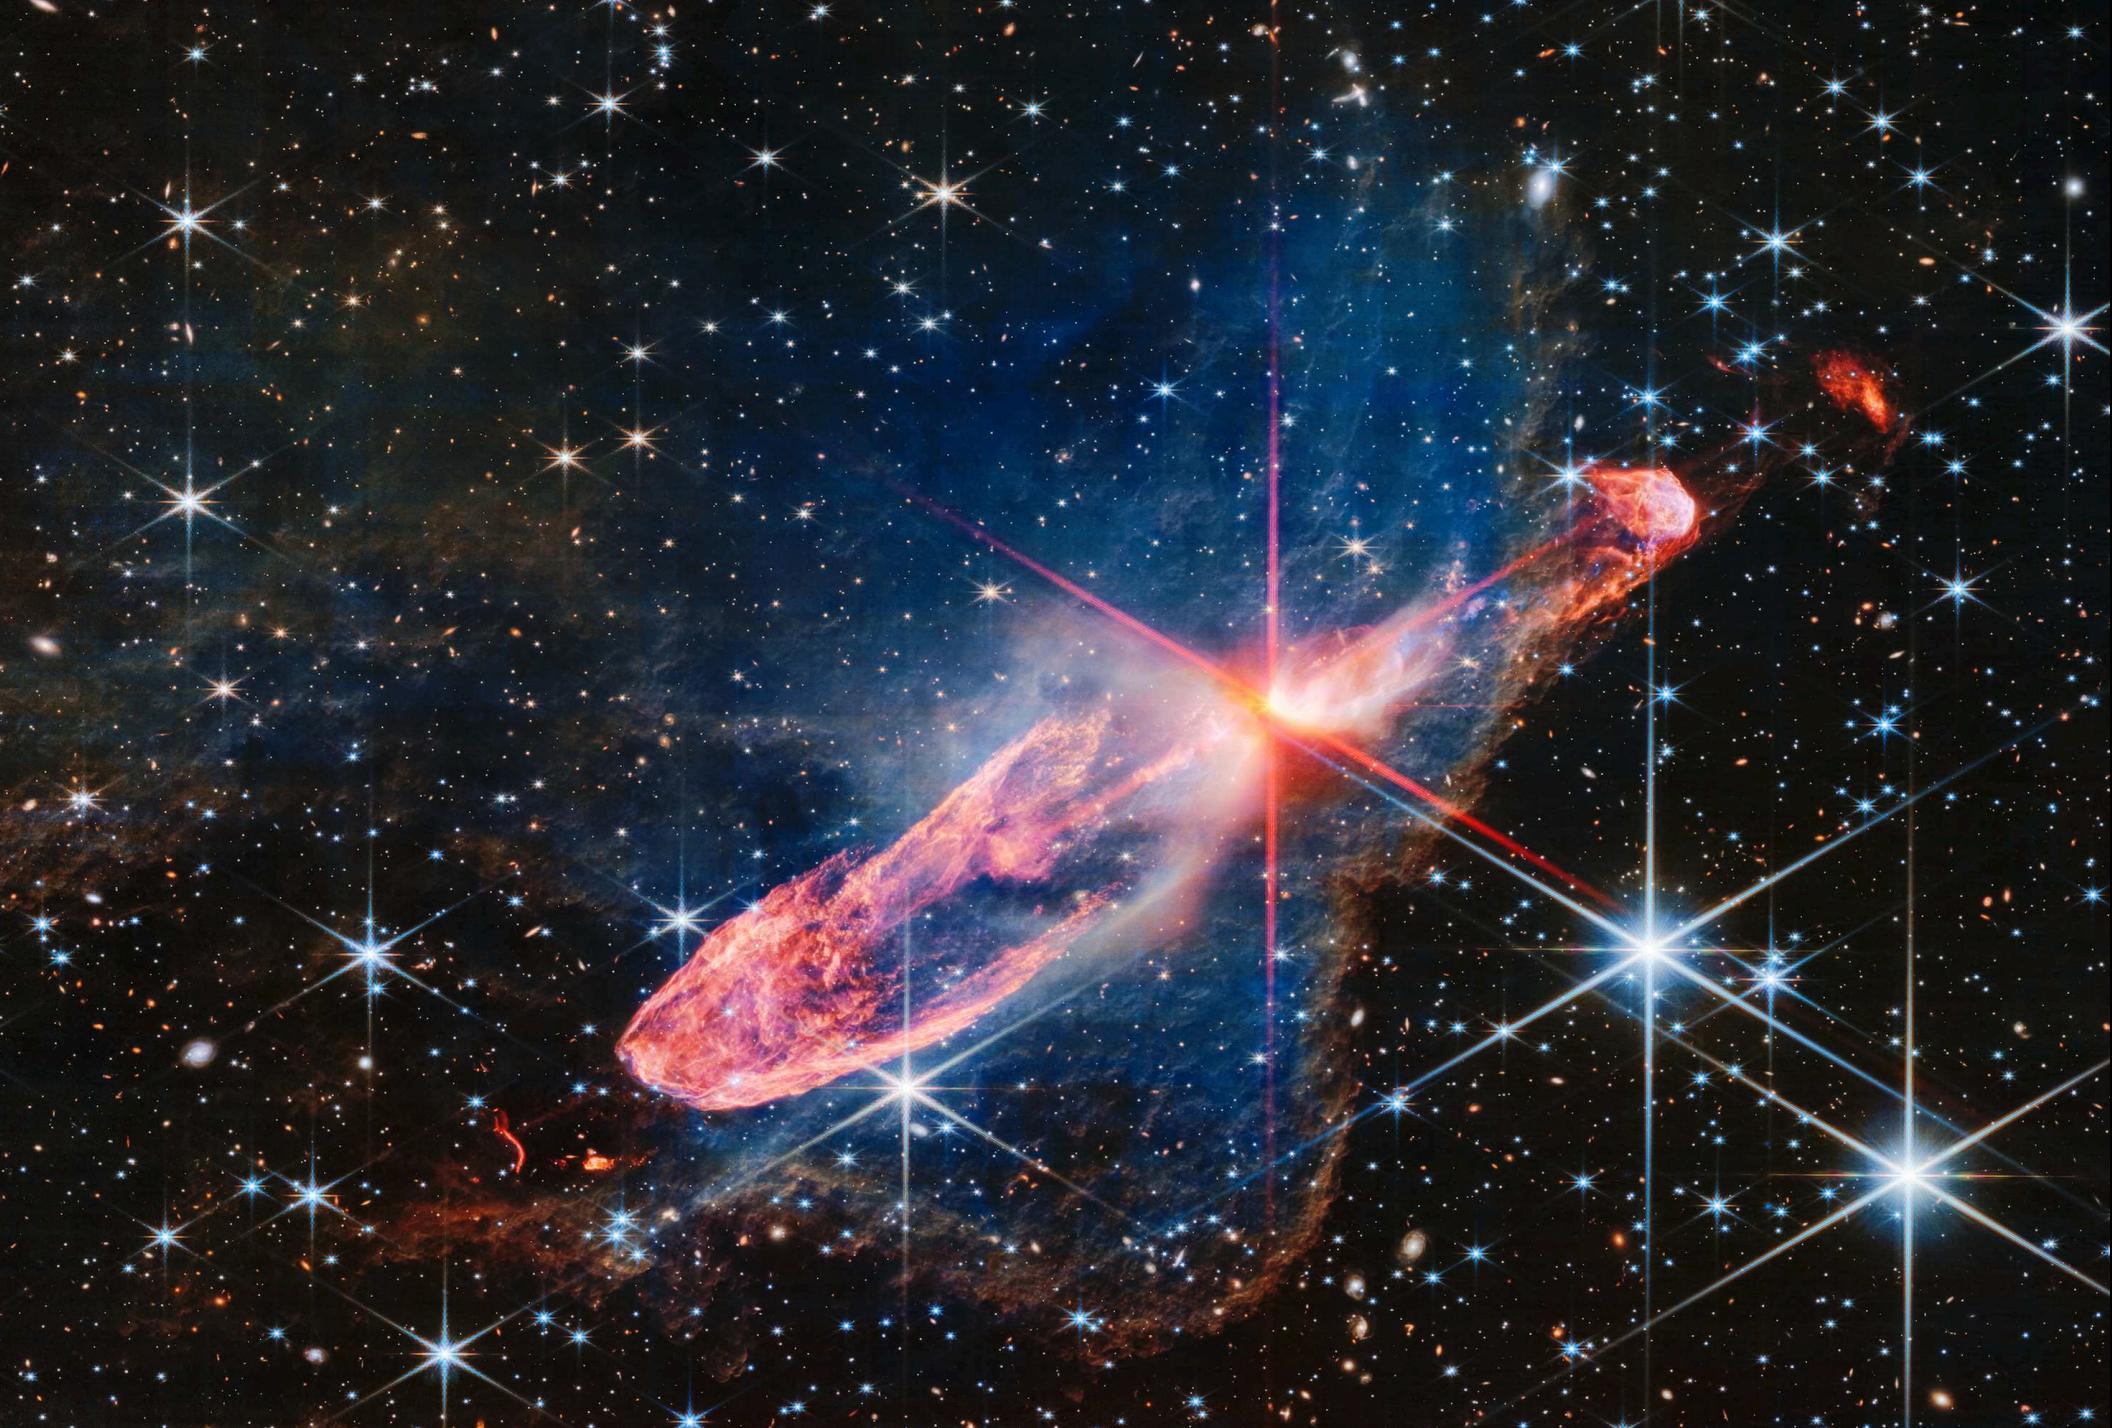

Our birth, *e.g.*, : Protoplanetary “Hourglass Nebula” L1527 at 460 lyrs.

- A forming protostar with  $\sim 30\%$  of Sun's mass only 100,000 year old!
- The protostar has surrounding accreting gas, and a circumstellar disk.
- Eventually, L1527 will start shining as a star, and have its own planets.

NIRCam+MIRI:  $\rho$  Ophiuchi dark cloud (closest stellar nursery at 456 lyrs):

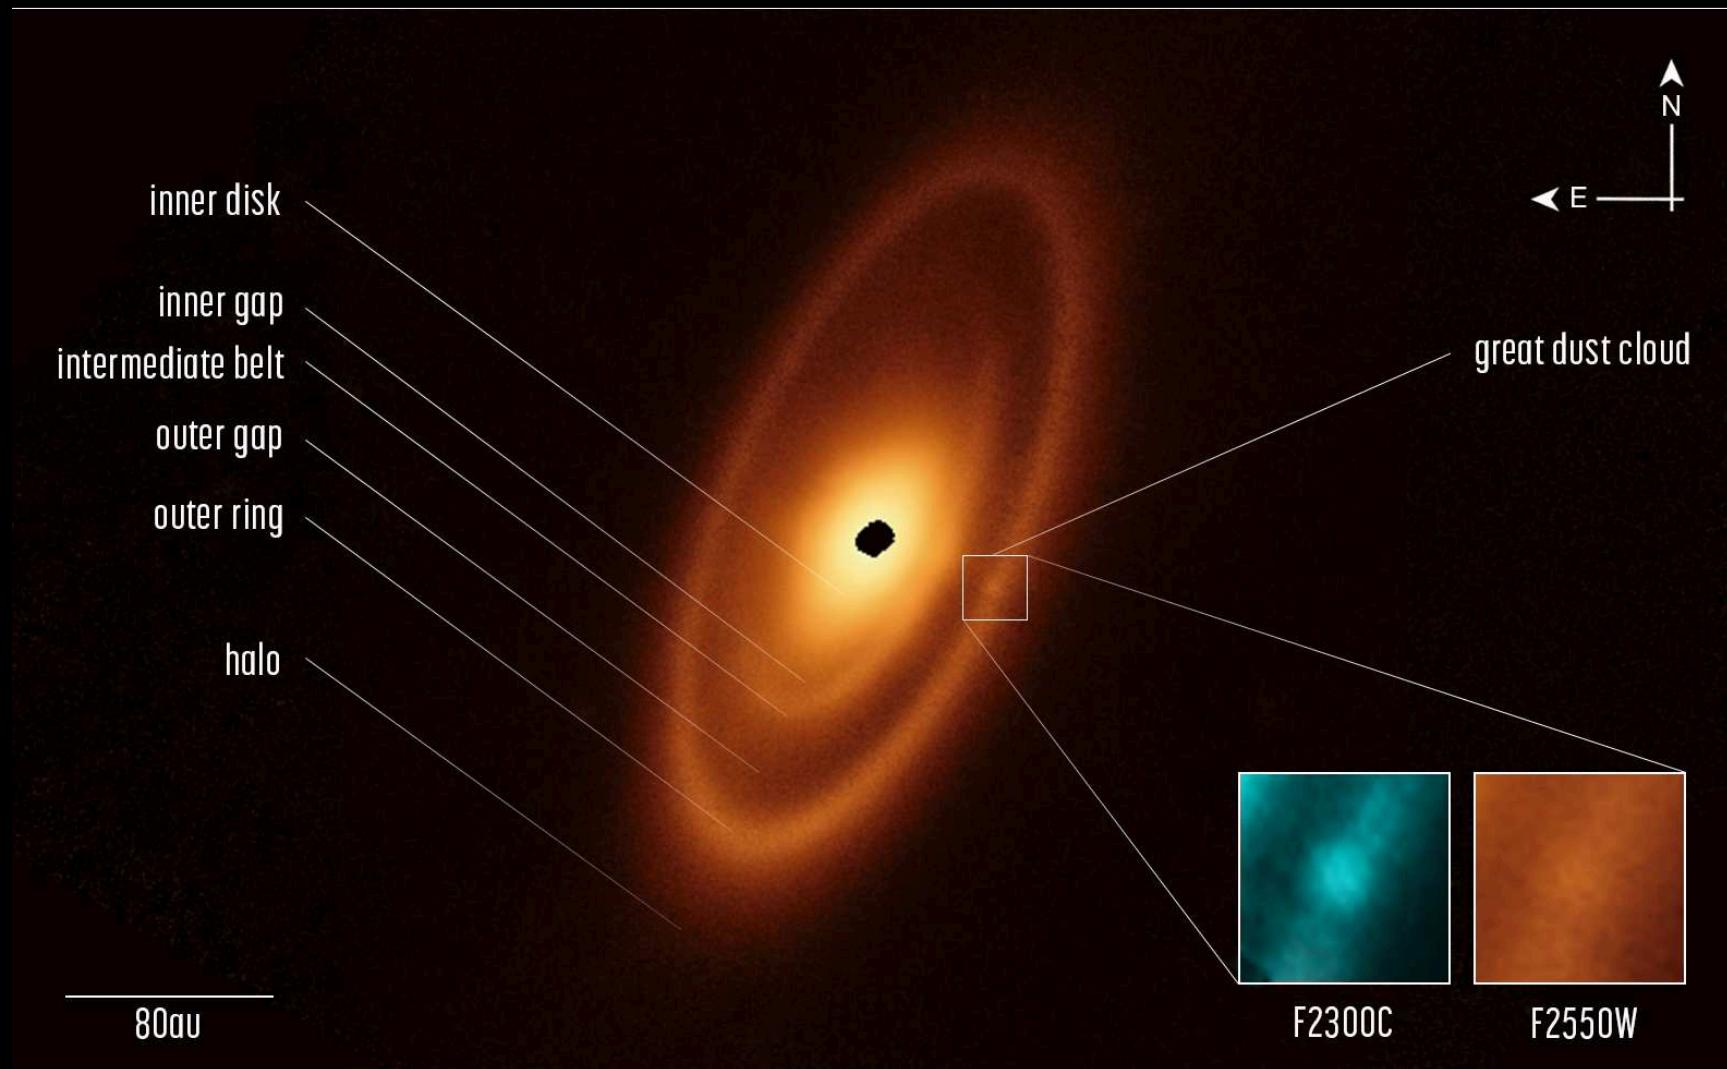

- Cradle of star-formation contains Polycyclic Aromatic Hydrocarbons!

Newly forming stars Herbig-Haro 46/47 with jet-expelled material (1470 lyrs):  
Formation of Sun-like stars is messy: inflow and outflow of gas & dust!

Webb 3–15 micron exoplanet images (10 Jupiter masses; 15 Myr young!)

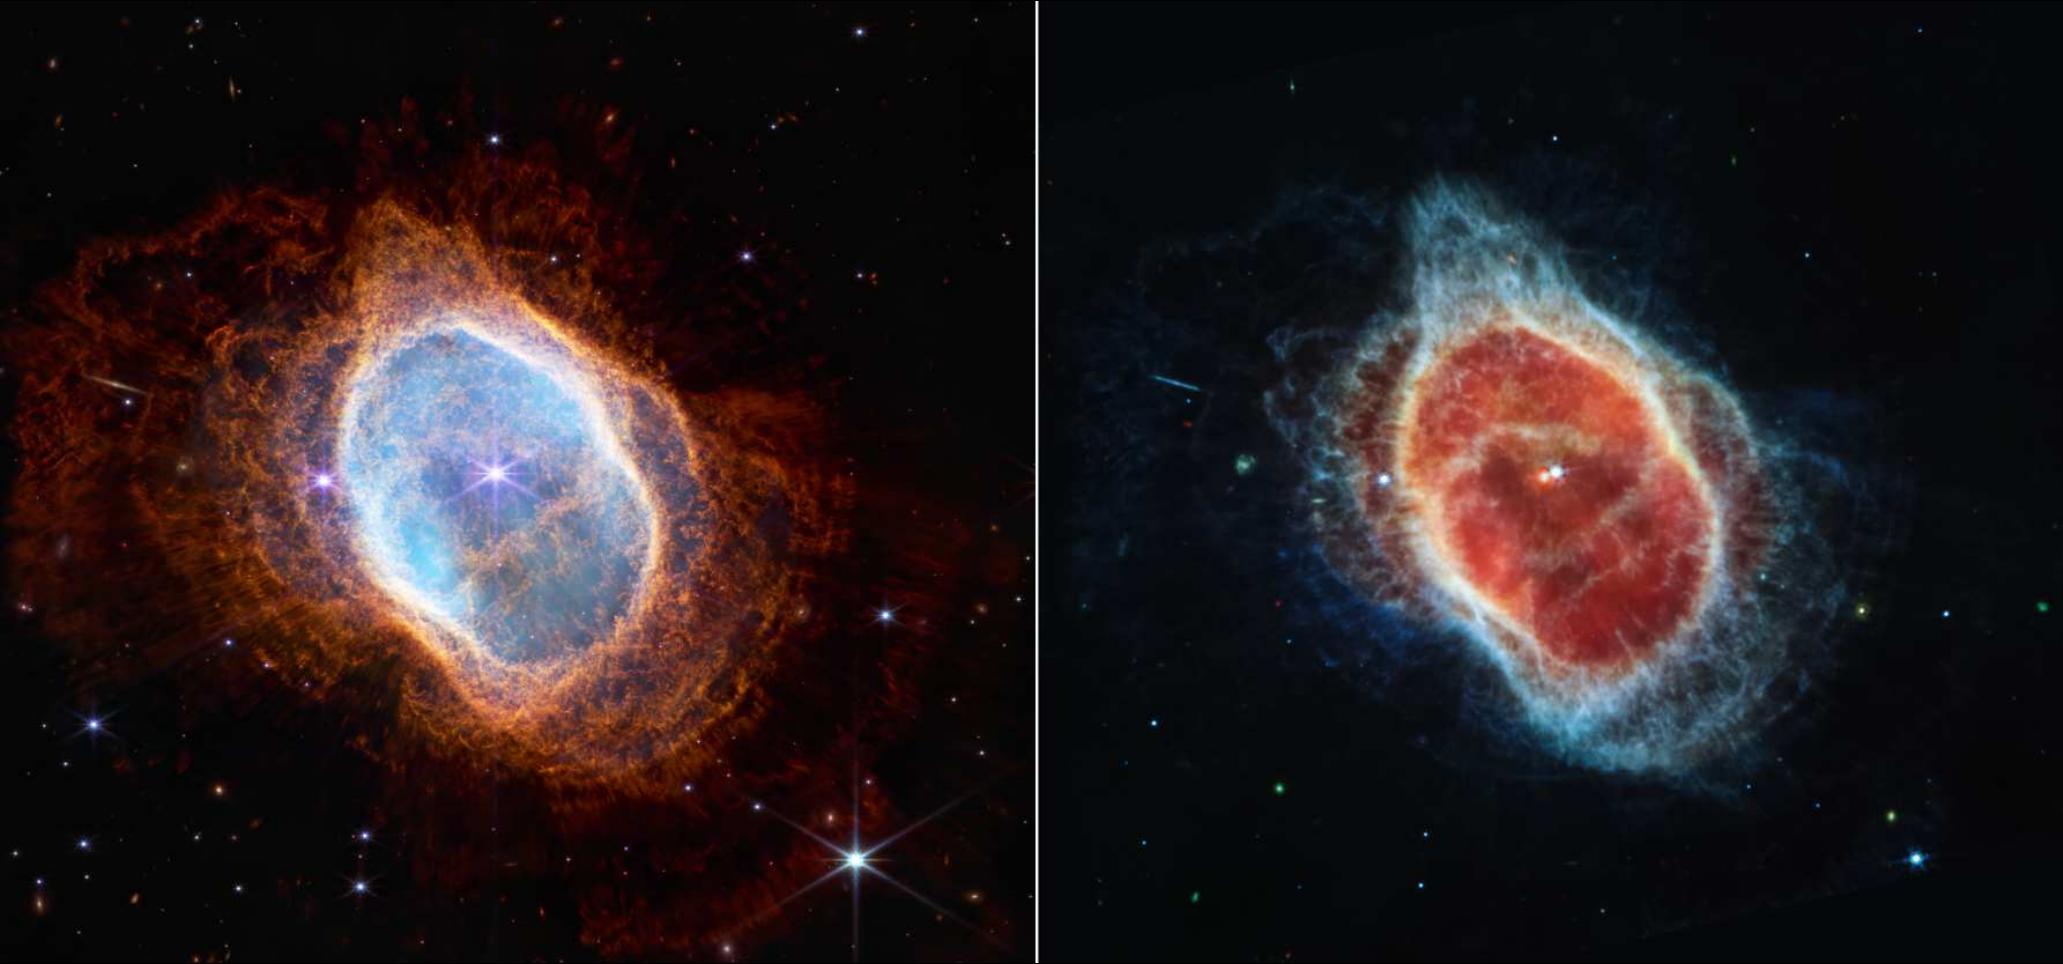

# ATMOSPHERE COMPOSITION

**WEBB**  
SPACE TELESCOPE

Hot exoplanet WASP-96b orbiting a Sun-like star (1150 light-years):

- Near-IR spectrum shows characteristic features of water (steam !).
- It has a temperature of 1000 F and is half Jupiter in mass.
- Webb will scan Earth-like exoplanets for building blocks of life.

### Southern Ring Nebula (Near-IR+Mid-IR; 2500 light-years):

- You *\*are\** witnessing the “Cosmic Circle of Life” here ...
- This is a Sun-like star expelling its outer layers in retirement ...
- It has exhausted its hydrogen and helium as nuclear fuel ...  
and expanded to  $>>100\times$  its current size, engulfing the Earth.

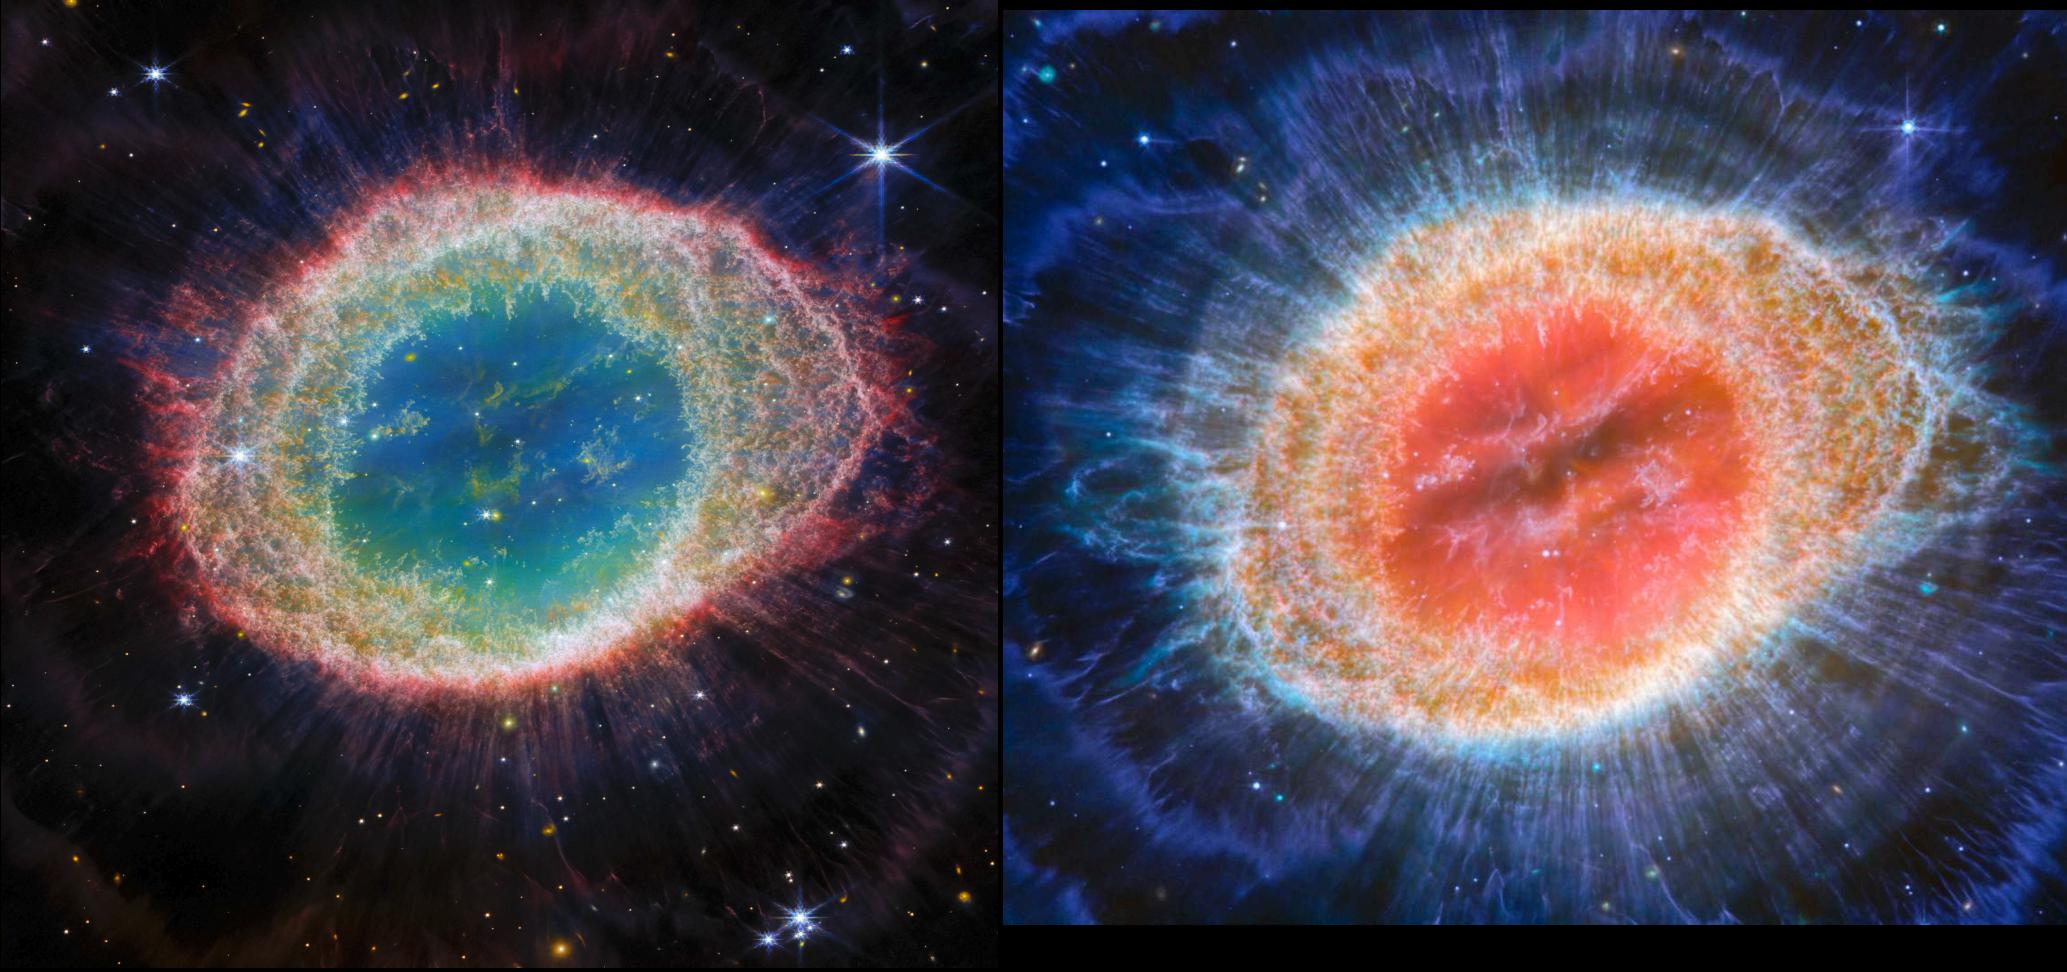

This is how our Sun *will* come to an end in 5 Billion years (near-IR).

Genesis 3:19: "... for dust thou art, and unto dust shalt thou return".

From gas expelled by previous sun-like stars, new stars are born (mid-IR).  
And thanks to the dust they expelled, new stars will form with planets ...

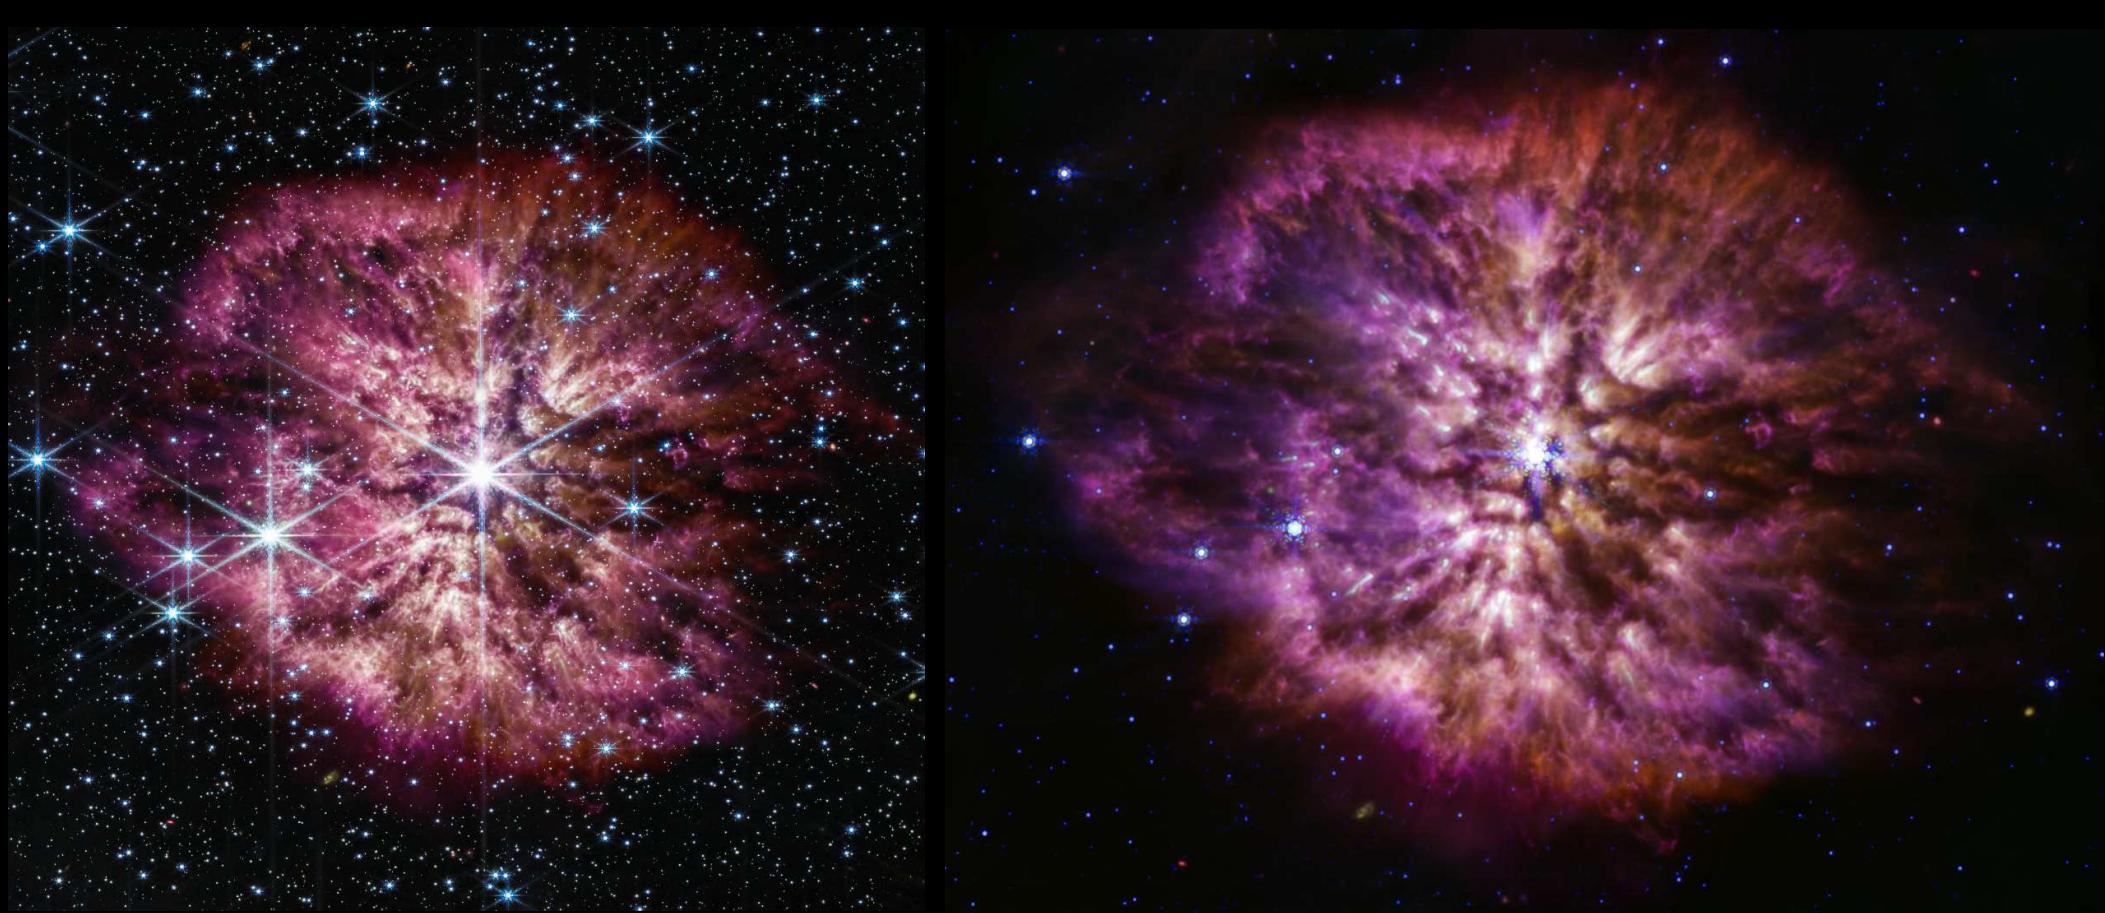

Webb images of THE Northern Ring Nebula in Lyra:

[Left] NIRCam & [Right] MIRI: mass loss in Asymptotic Giant Branch stage.

- This is how our Sun *will* come to an end in 5 Billion years ...

and leave an ultra hot dim white dwarf star behind in the center.

Genesis 3:19: "... for dust thou art, and unto dust shalt thou return".

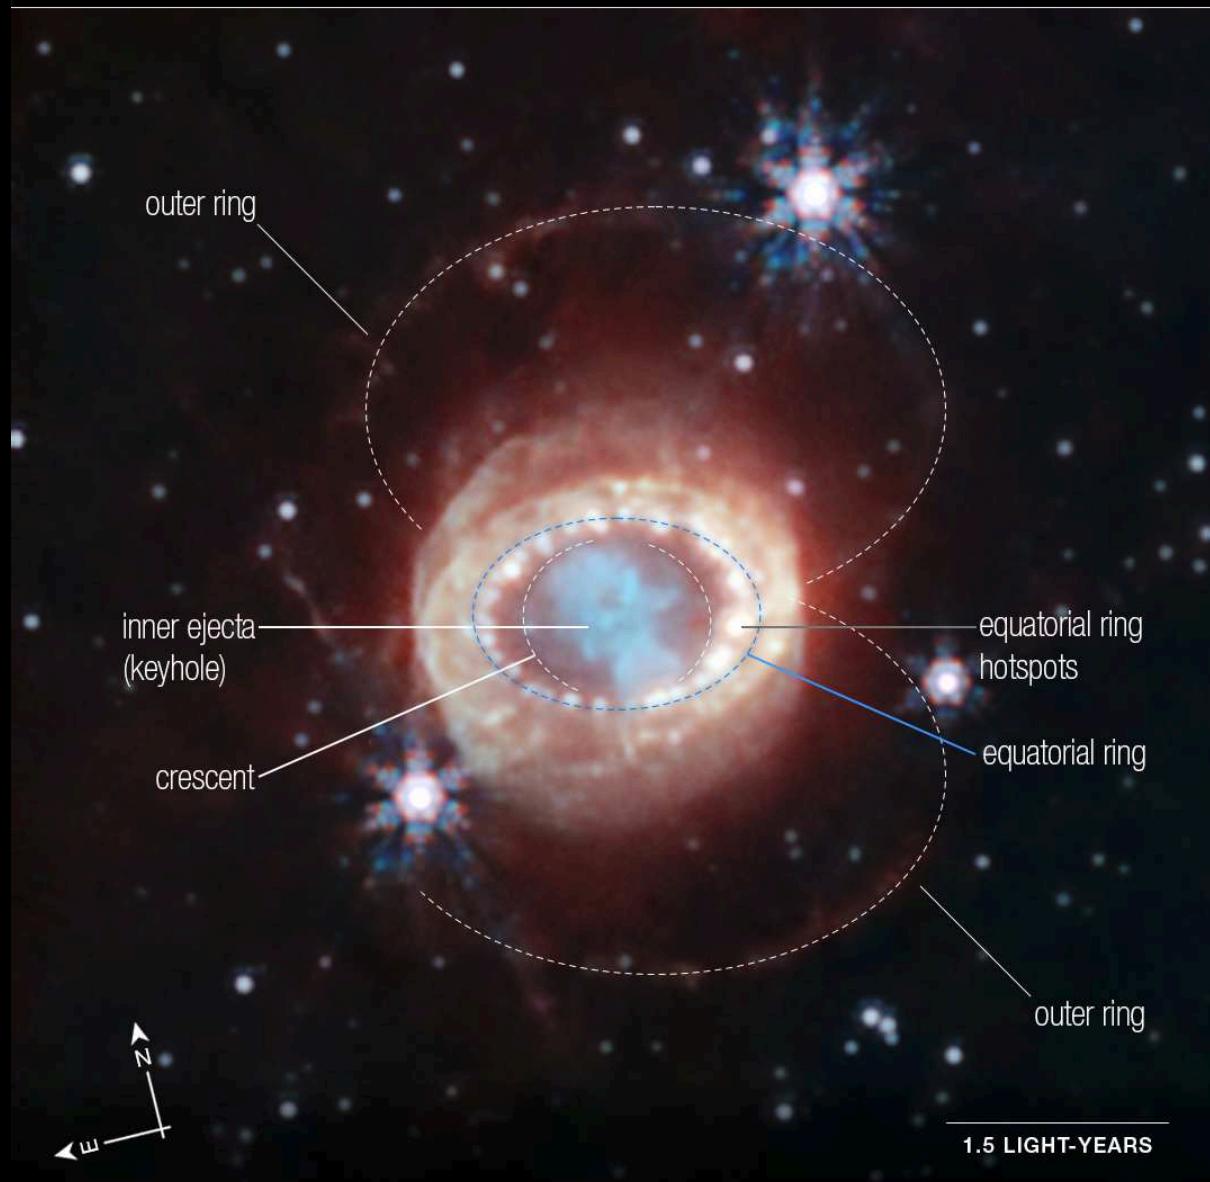

30 solar mass Wolf Rayet star WR124 shortly before it turns Supernova ...

- [Left] NIRCam and [Right] MIRI — both showing recent mass loss.
- Prelude stage to Supernova also releases a lot of (dusty) mass!

Genesis 3:19: "... for dust thou art, and unto dust shalt thou return".

JAMES WEBB SPACE TELESCOPE  
**SUPERNOVA 1987A**

M83 spiral galaxy MIRI (mid-IR): ... and dust thou shalt return, stars!

Webb NIRCam and MIRI images of nearby galaxies:  
Cosmic star-formation and dust production ubiquitous throughout the universe!  
The “Cosmic Circle of Life” rules throughout the universe!

- (3) Viewing the Universe through the “Eyes of Einstein”

Webb is observing many things Einstein correctly predicted, yet doubted:  
Gravitational lensing, Black Holes, the Hubble Expansion,  $\Lambda$  ...

Stephan's Quintet: 4 colliding galaxies (290 M-lyr; left spiral is foreground).

- These major “Cosmic Trainwrecks” are much more common in the past.
- Sun-like stars formed in aftermath of minor “Cosmic Fender-benders” .

Stephan's Quintet: 4 colliding galaxies at 290 million light-years (Mid-IR):

- Mid-IR shows molecular gas being pulled out during collision.
- Gravity from collision in top galaxy feeds the Beast: central black hole!

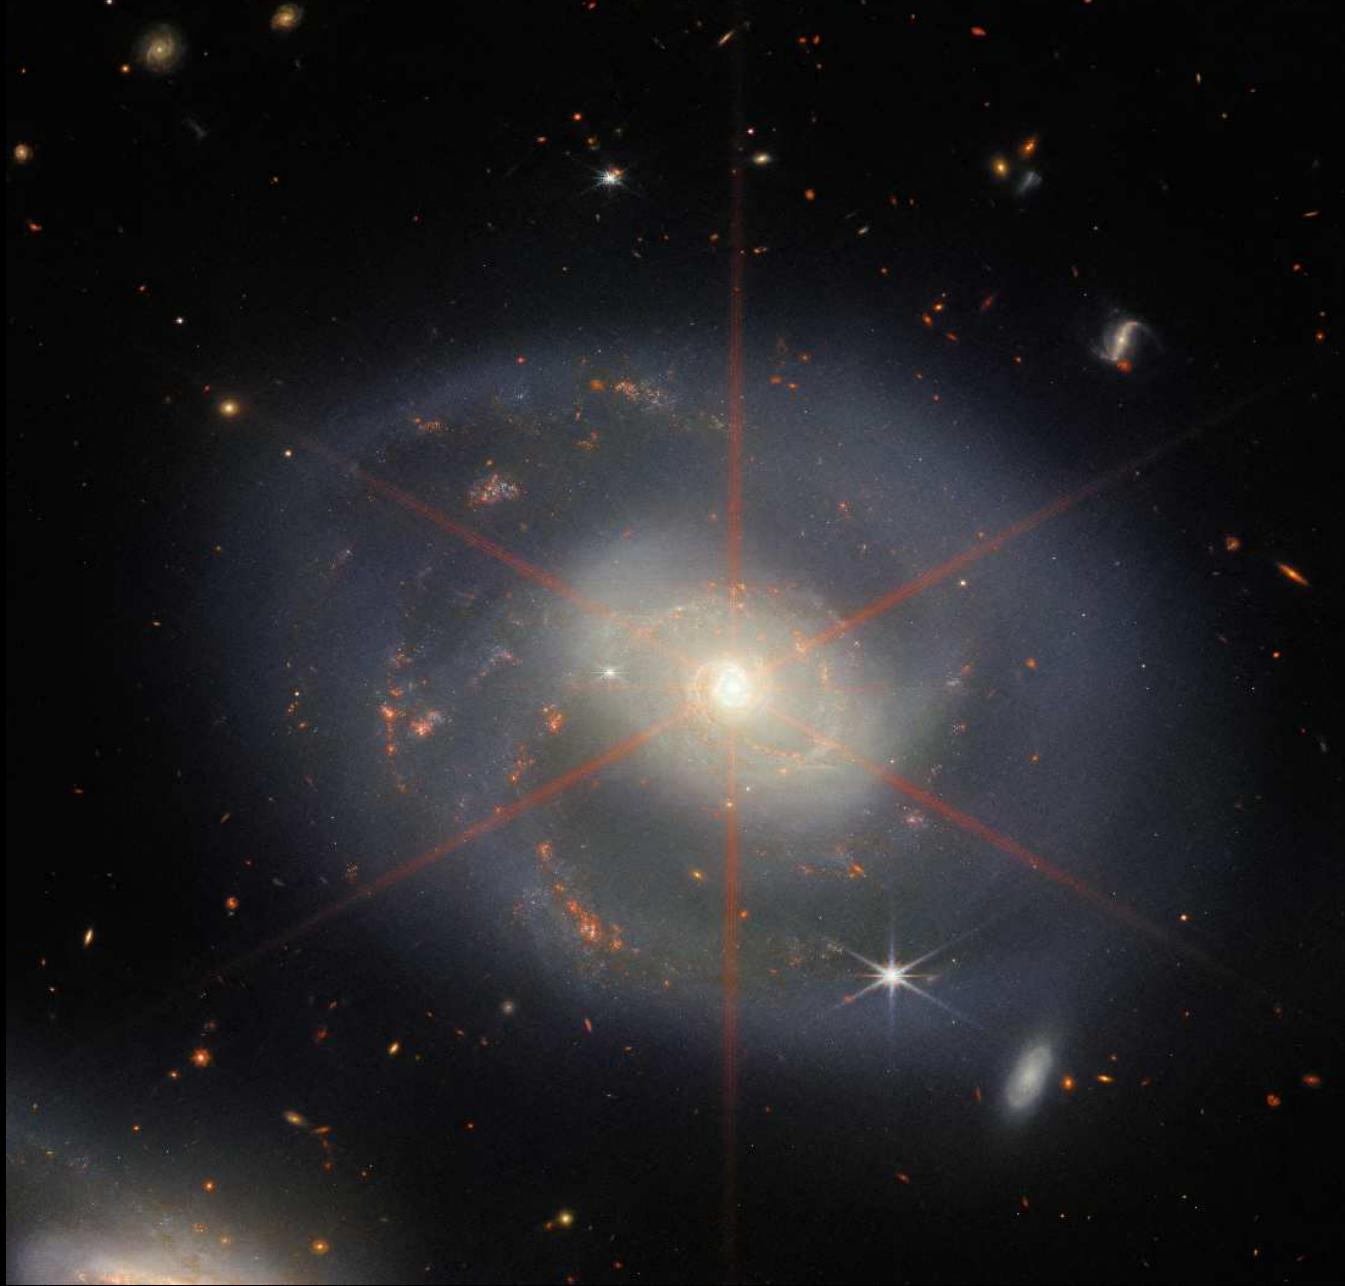

NGC1433 a galaxy with dusty spiral arms at 48 million light-years

NGC7496 a galaxy with dusty spiral arms at 24 million light-years:

- Inner spiral arms feed the central monster (supermassive black hole!)

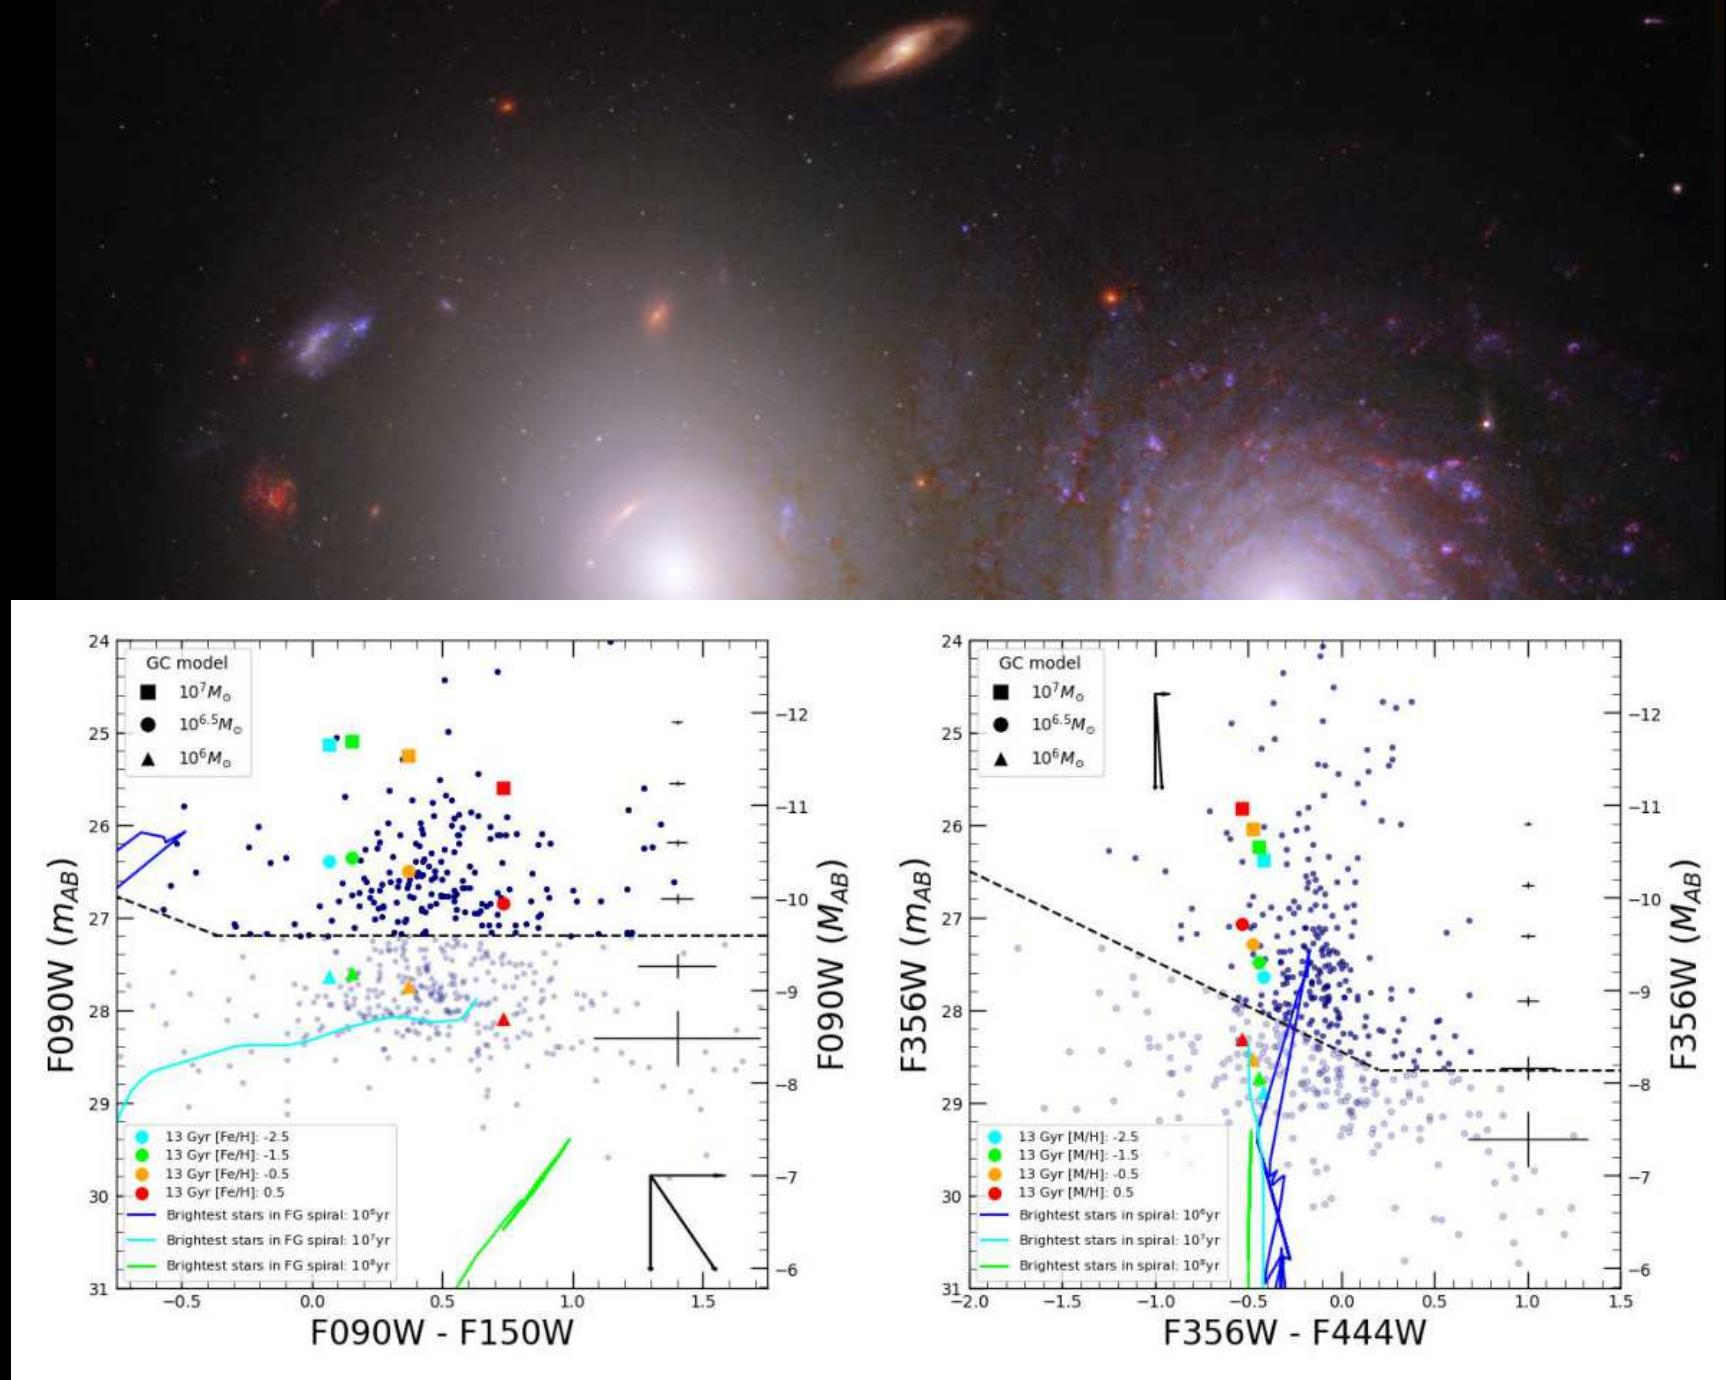

Don't feed the animals: NGC7469, a spiral galaxy at 220 million light-years:

- It has a supermassive black hole (SMBH) feasting on the in-falling gas!
- In area surrounding the SMBH, gas is expelled at very high speeds.

- Spiral overlapping Elliptical VV191: Tracing dust: small grains! (Keel<sup>+</sup> 23).
- 150 Globular Clusters in  $z=0.0513$  Elliptical (Berkheimer<sup>+</sup> 2024, ApJ, 964, L29).

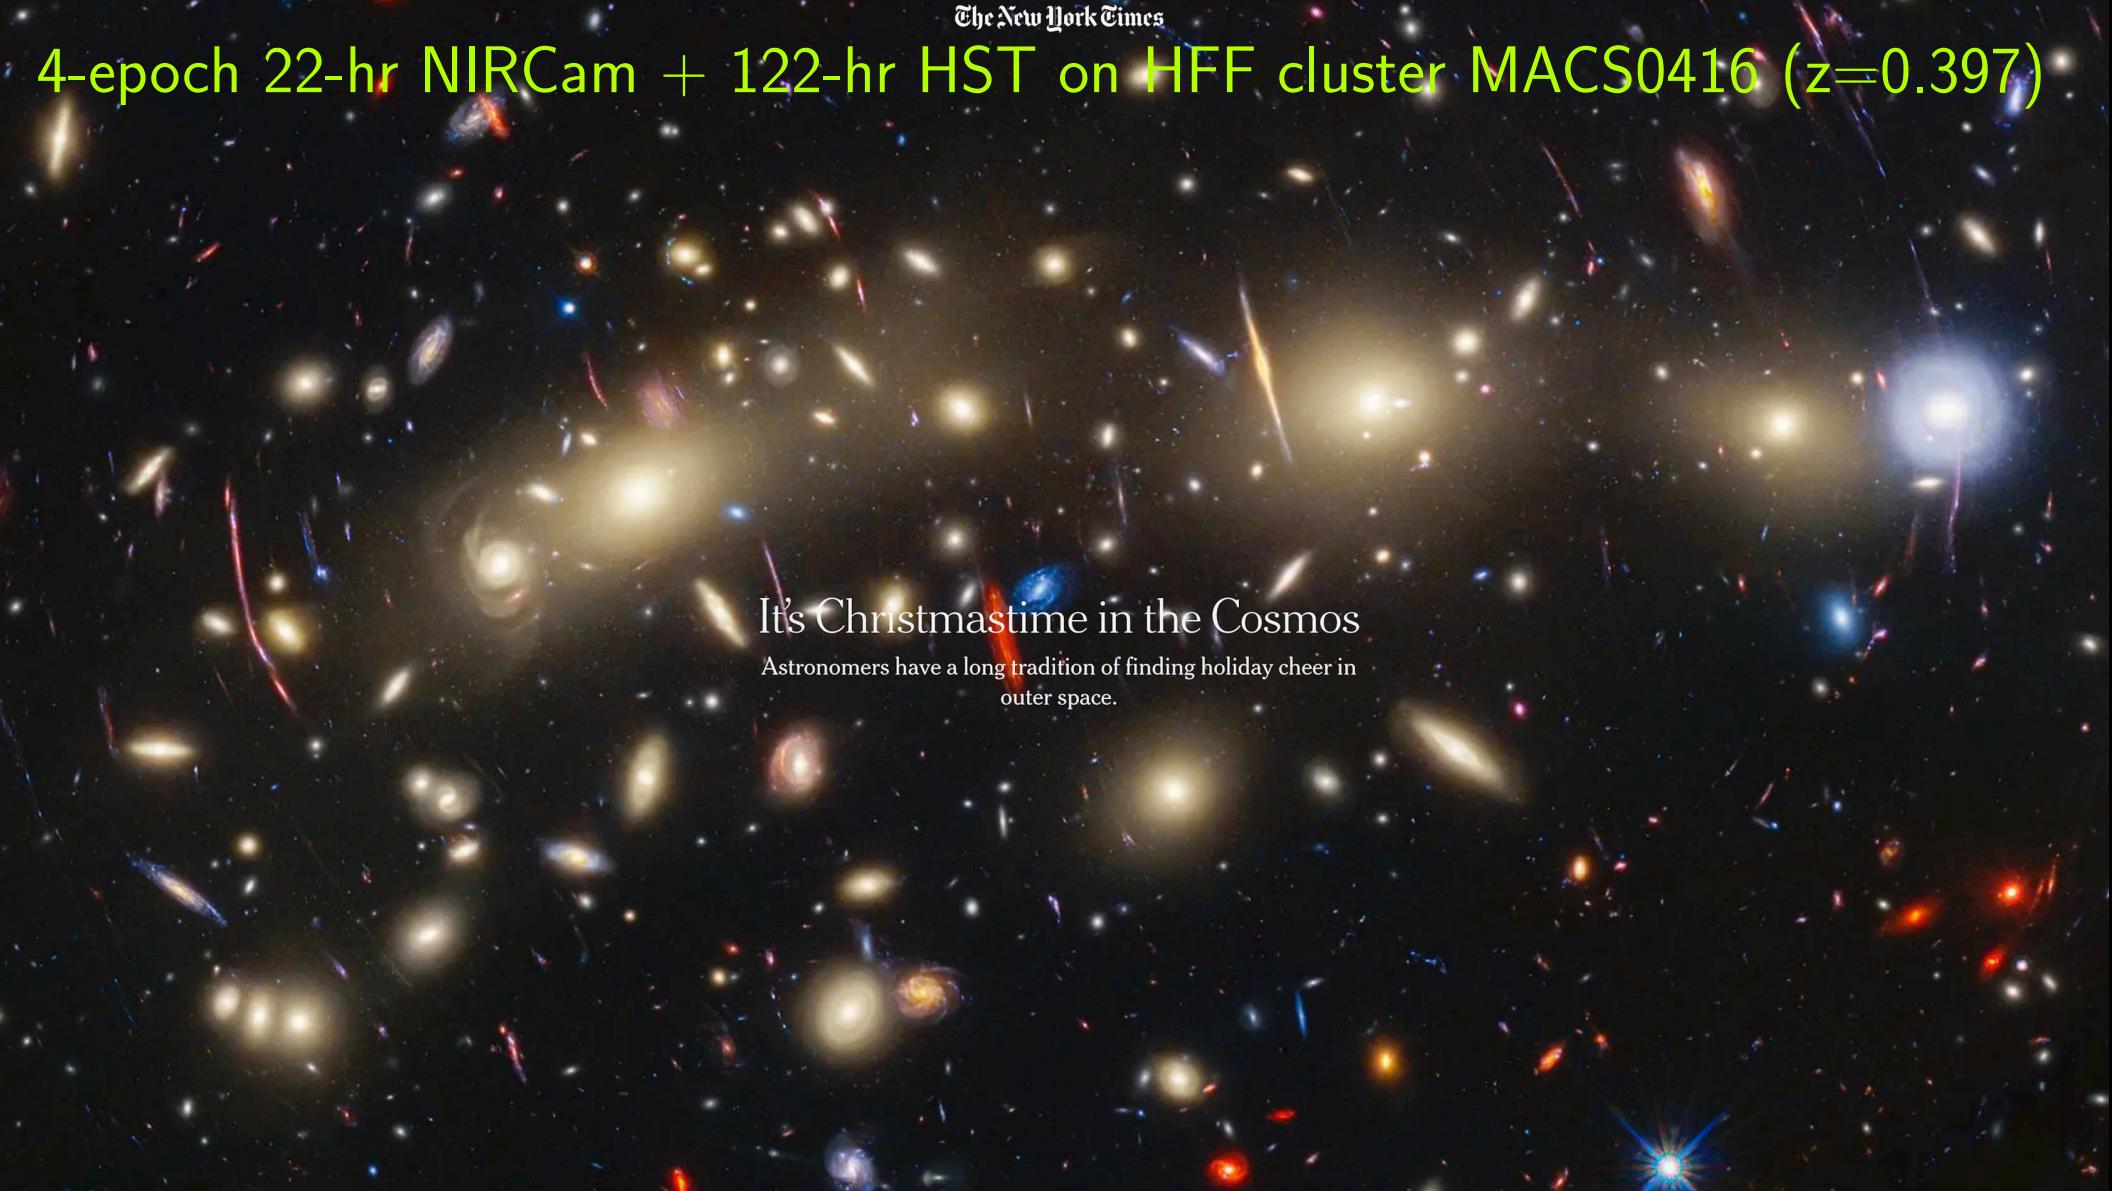

- Spiral overlapping Elliptical VV191: Tracing dust: small grains! (Keel<sup>+</sup> 23).
- Webb measures GC masses/ages at large distances! (Berkheimer<sup>+</sup> 2024, ApJ, 964, L29).

... and the  $z=0.0513$  Elliptical also lenses a background galaxy at  $z \sim 1$  (Keel<sup>+</sup> 2023, AJ, 165, 16)!

## ABSTRACT

We compare the abundance of prolate-shaped galaxies reported in deep surveys with the predicted stellar morphology of young galaxies in high resolution hydrodynamical simulations of Cold Dark Matter (CDM), Warm Dark Matter (WDM) and Wave/Fuzzy Dark Matter,  $\psi$ DM. For both CDM and WDM we have sufficient volume,  $10^3 Mpc^3$ , to yield galaxies with stellar masses over  $> 10^9 M_\odot$  at  $z > 2$ , allowing comparison with the CEERS and CANDELS surveys. We find the observed elongation of young galaxies is well matched by WDM, during the first  $\simeq 500$  Myr when material steadily accretes along smooth filaments, with little dependence on stellar mass over the range  $10^{8-10} M_\odot$  in our simulations. The dark matter halos of WDM and  $\psi$ DM both show prolate elongation, similar to that of the stars, indicating a shared, triaxial equilibrium. This contrasts with CDM where the early stellar morphology is mainly spheroidal, formed from fragmented filaments with frequent merging, resulting in modest triaxiality. For CDM, several visible subhalos are typically predicted to orbit within the virial radius of each galaxy, whereas sub-halos are absent for WDM and  $\psi$ DM, as early merging is rare. Long, smooth filaments may be traced with JWST by alignment of neighbouring elongated galaxies on a predicted scale of  $\simeq 150$  kpc, set by the DM particle mass.

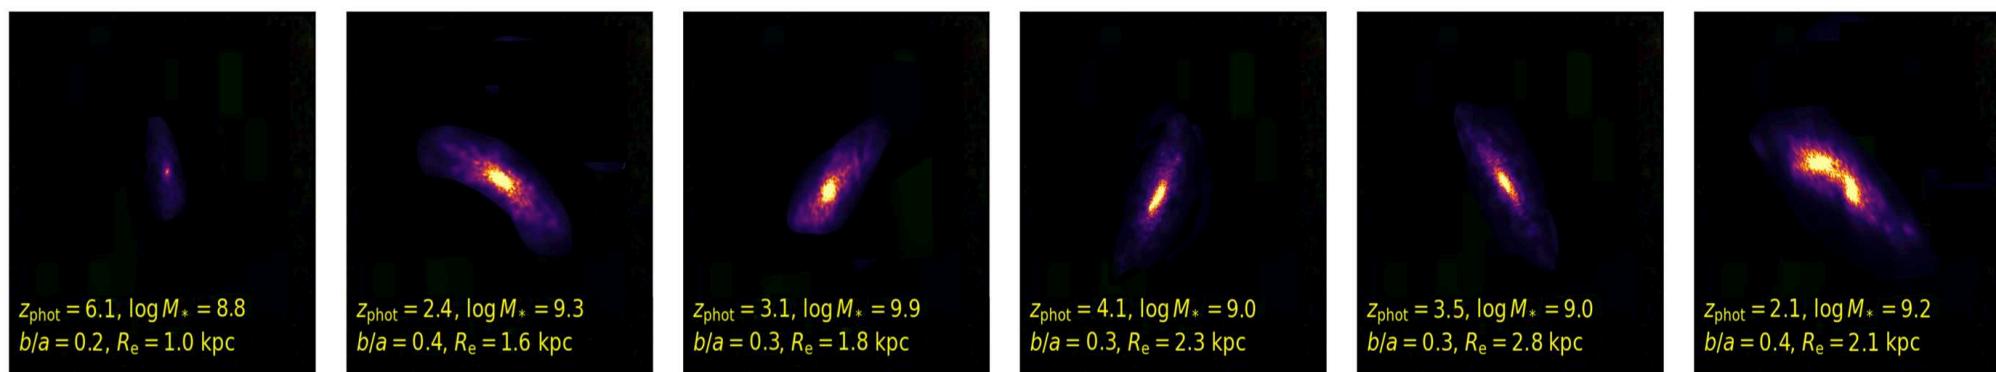

A. Pozo et al. 2025, Nature Astronomy, in press:

JWST & HST galaxies often elongated (prolate)  $\iff$  smooth WDM filaments

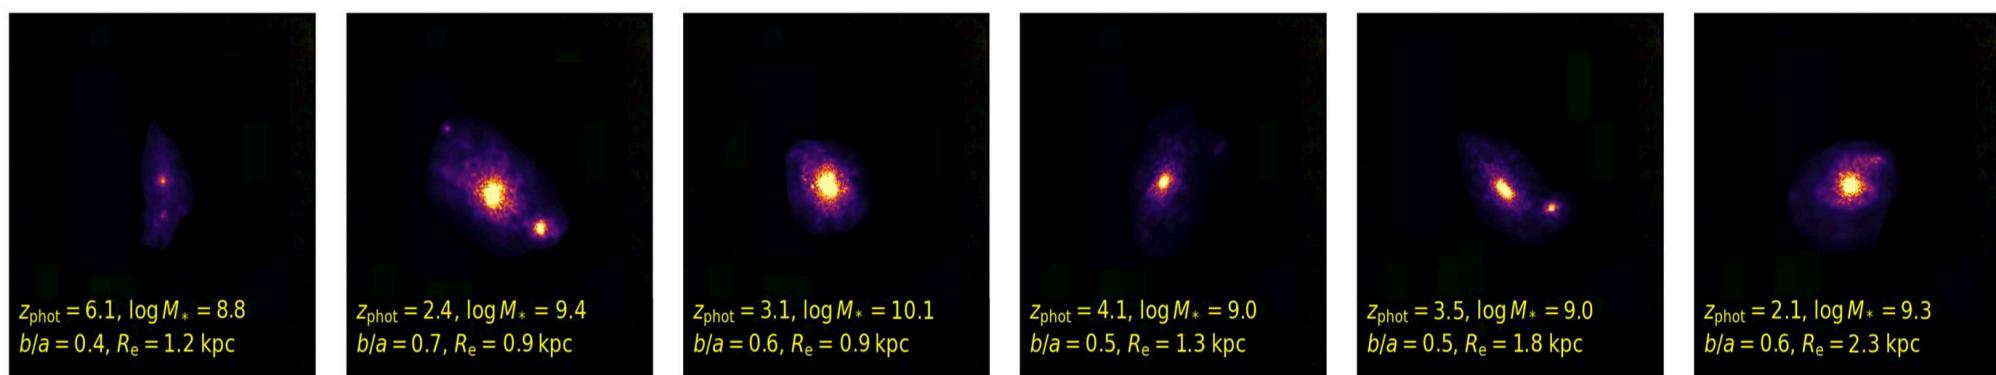

JWST

WDM

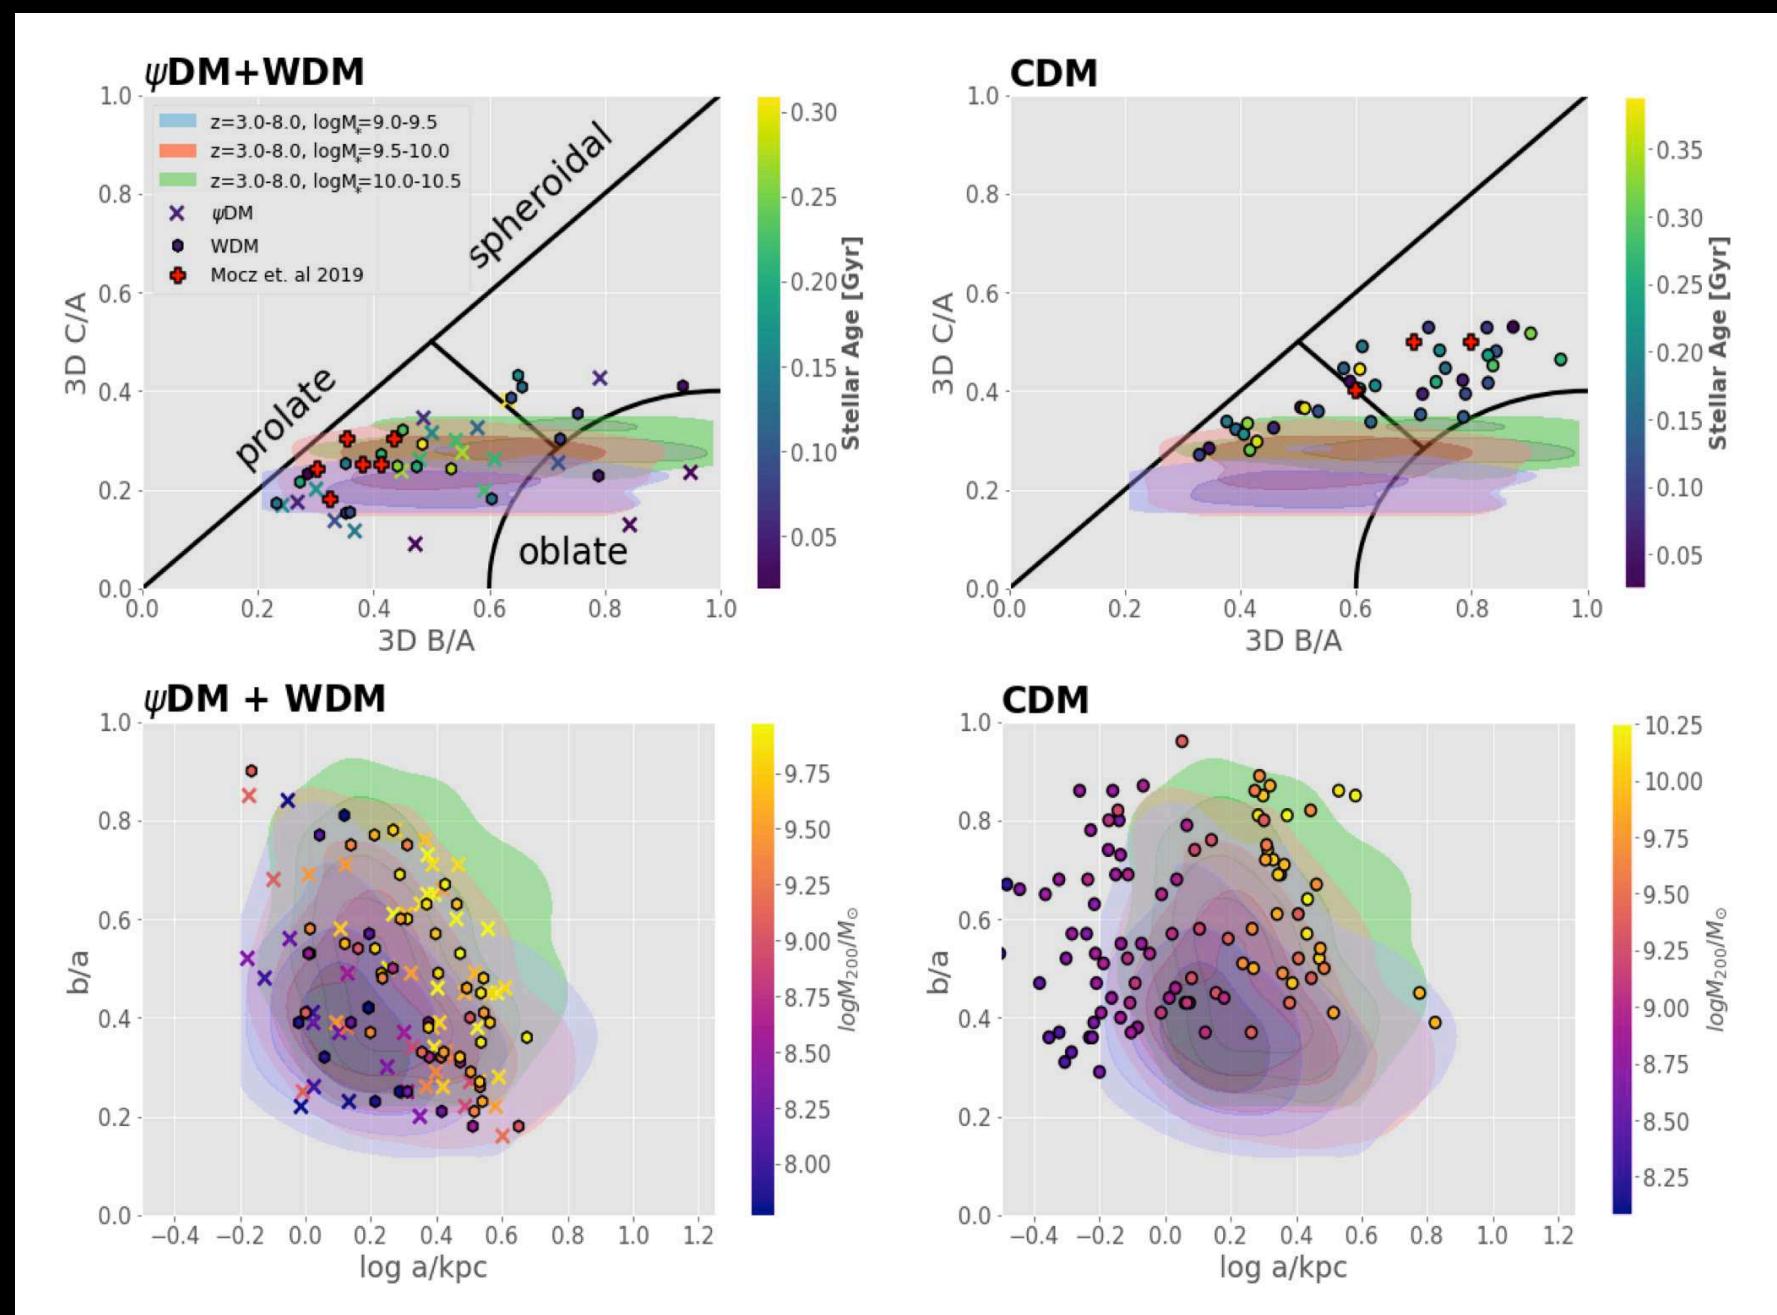

CDM

A. Pozo et al. 2025, Nature Astronomy, in press:

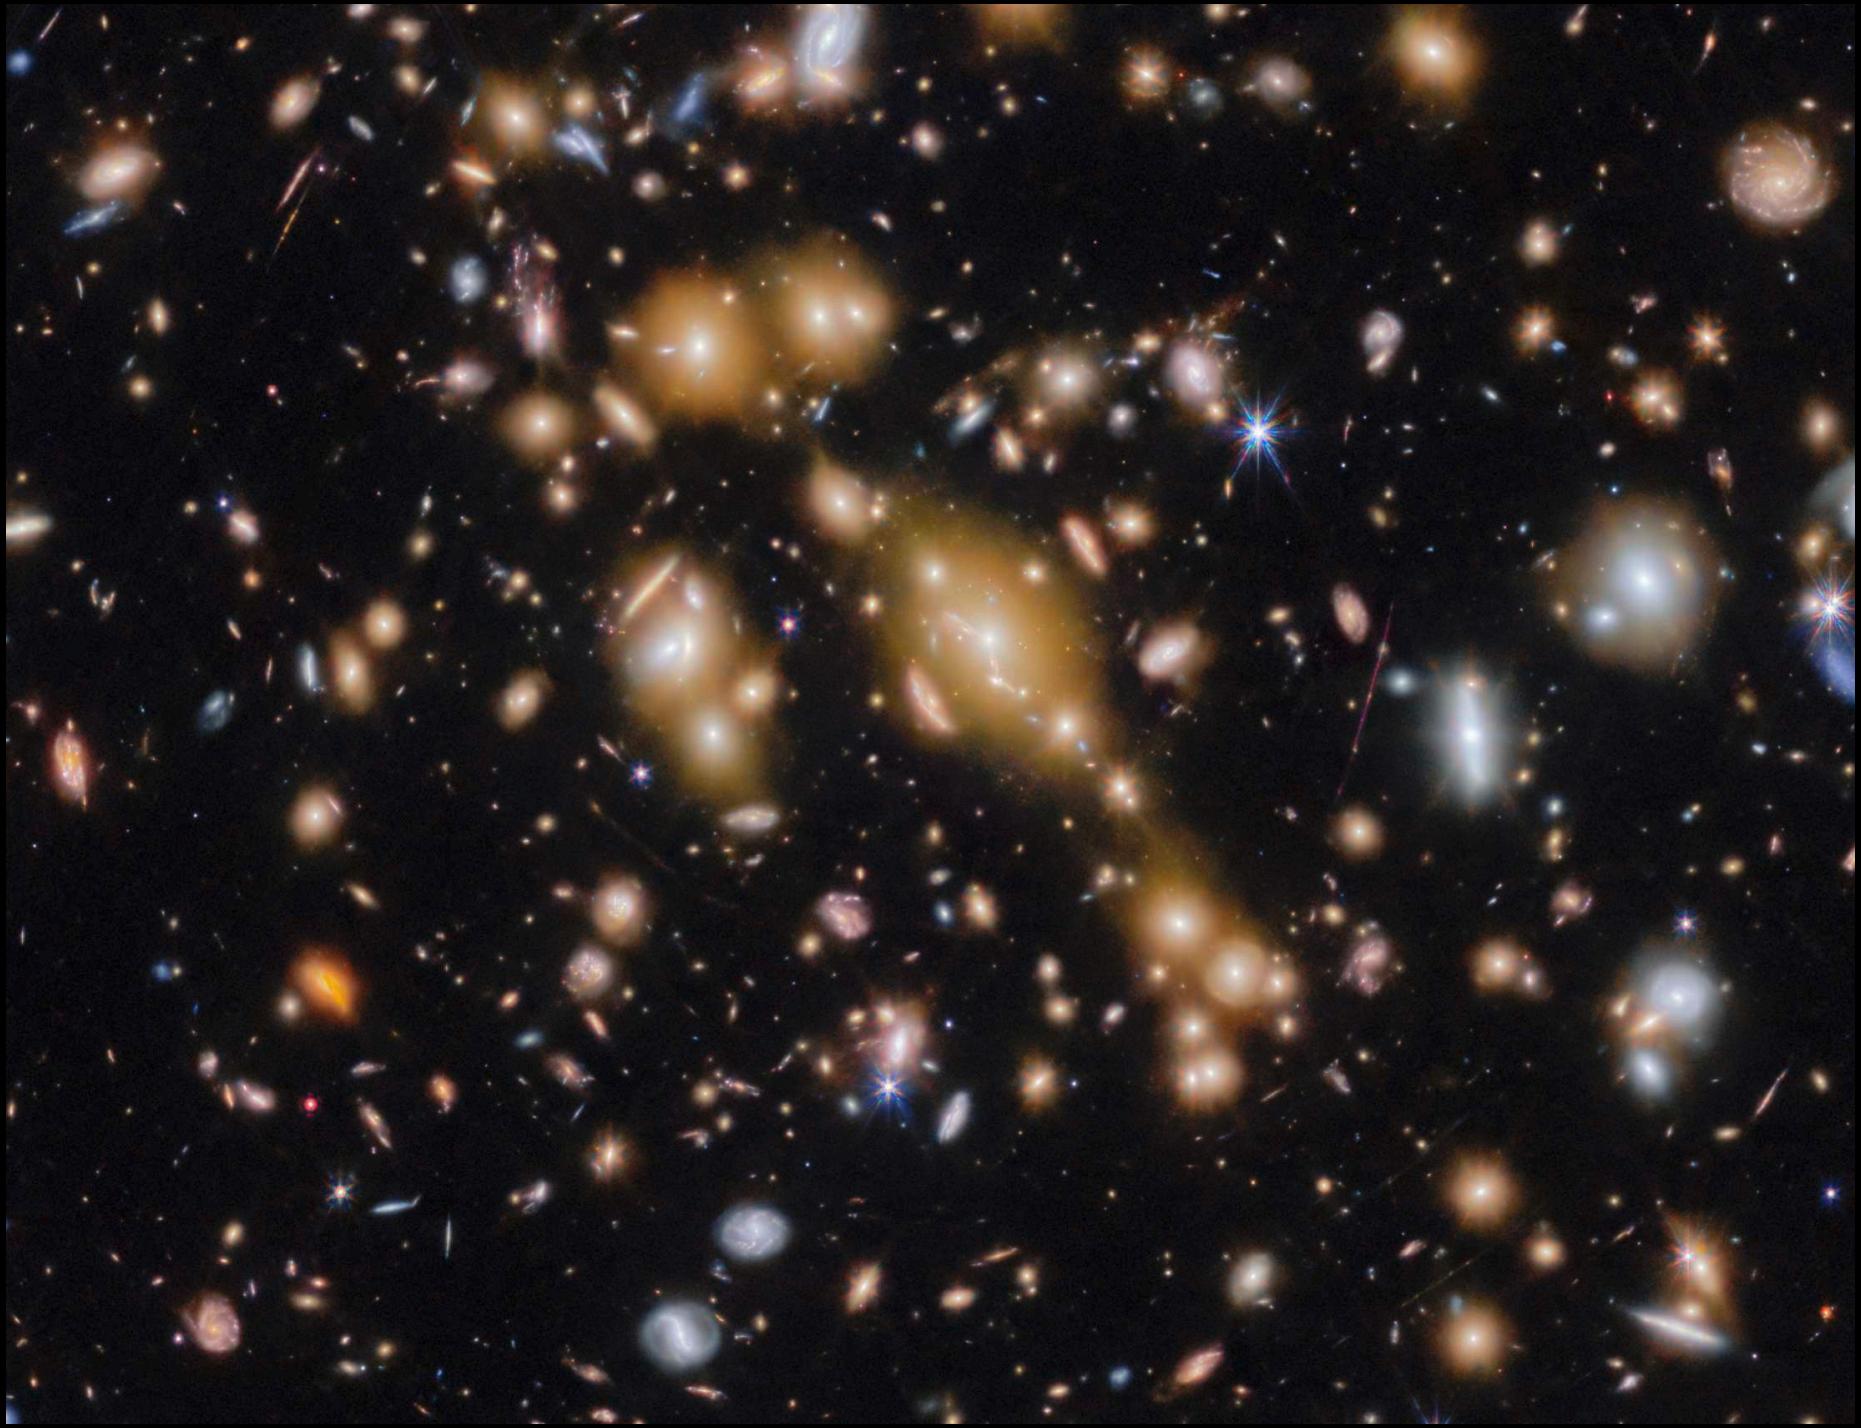

Prolate JWST and HST morphology better explained by WDM than CDM !

A. Pozo et al. 2025, Nature Astronomy, in press:

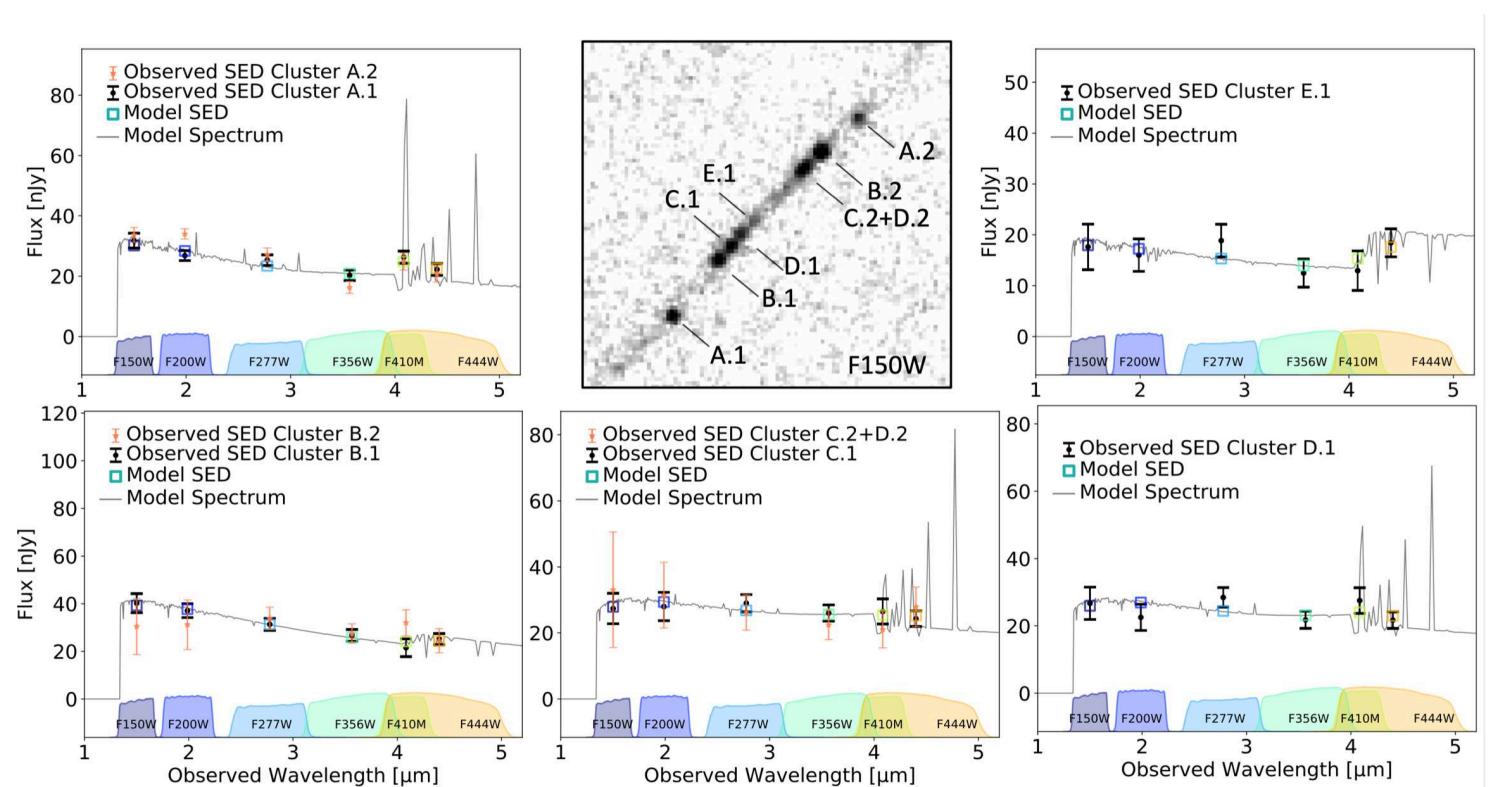

CDM predictions too round & too small;  $\Psi$ DM+WDM model follows the data

Contours trace the JWST & HST data (CANDELS & CEERS); Dots are the model predictions.

$z=0.97$  cluster SPT0615: lenses young globular clusters at  $z=10.2$  !

Adamo<sup>+</sup> (Nature; astro-ph/2401.03224):  $\sim 50$  Myr old, formed at  $z \sim 11$ ! <https://esawebb.org/news/weic2418/>

$z=0.97$  cluster SPT0615: lenses young globular clusters at  $z=10.2$  !

- Webb yields Globular Cluster ages/masses at  $z=10.2 \rightarrow z_{form} \lesssim 11$ !

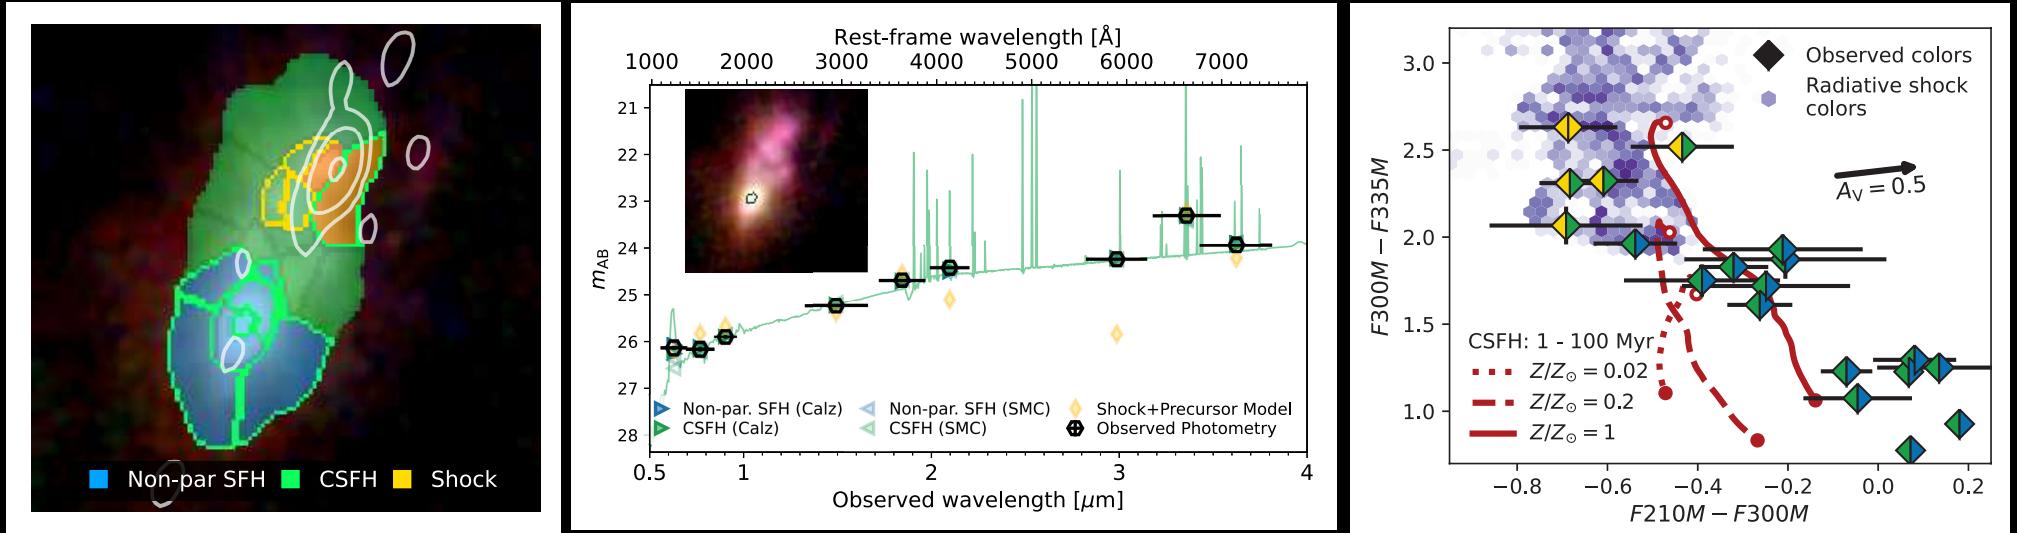

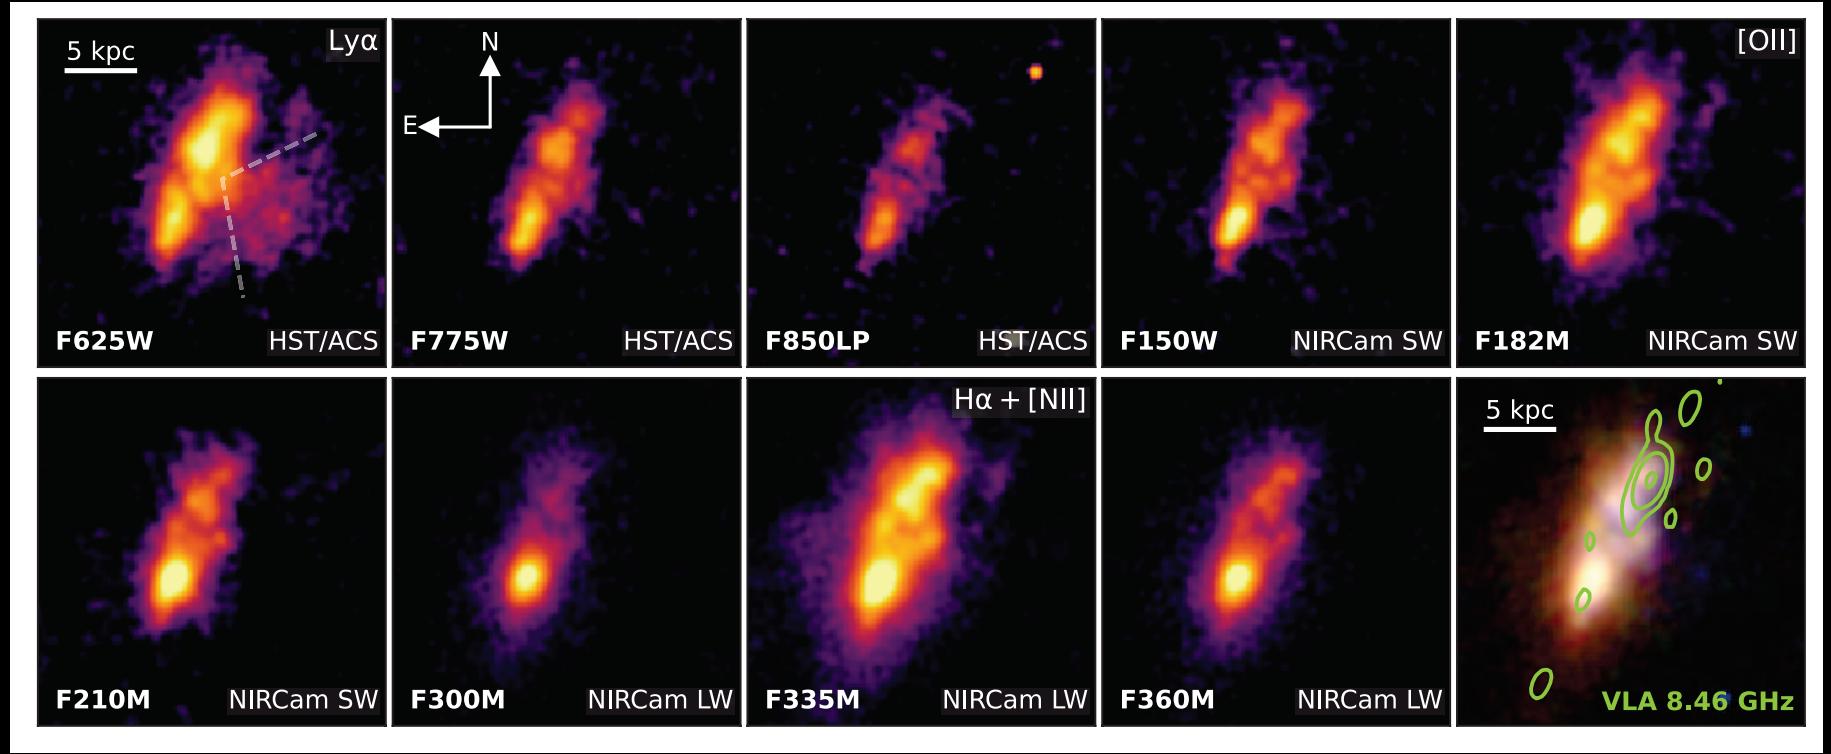

- $z \gtrsim 1$  universe is littered with galaxy mergers and supermassive black holes!

We live in a *boring* galaxy far away from major mergers & SMBHs!

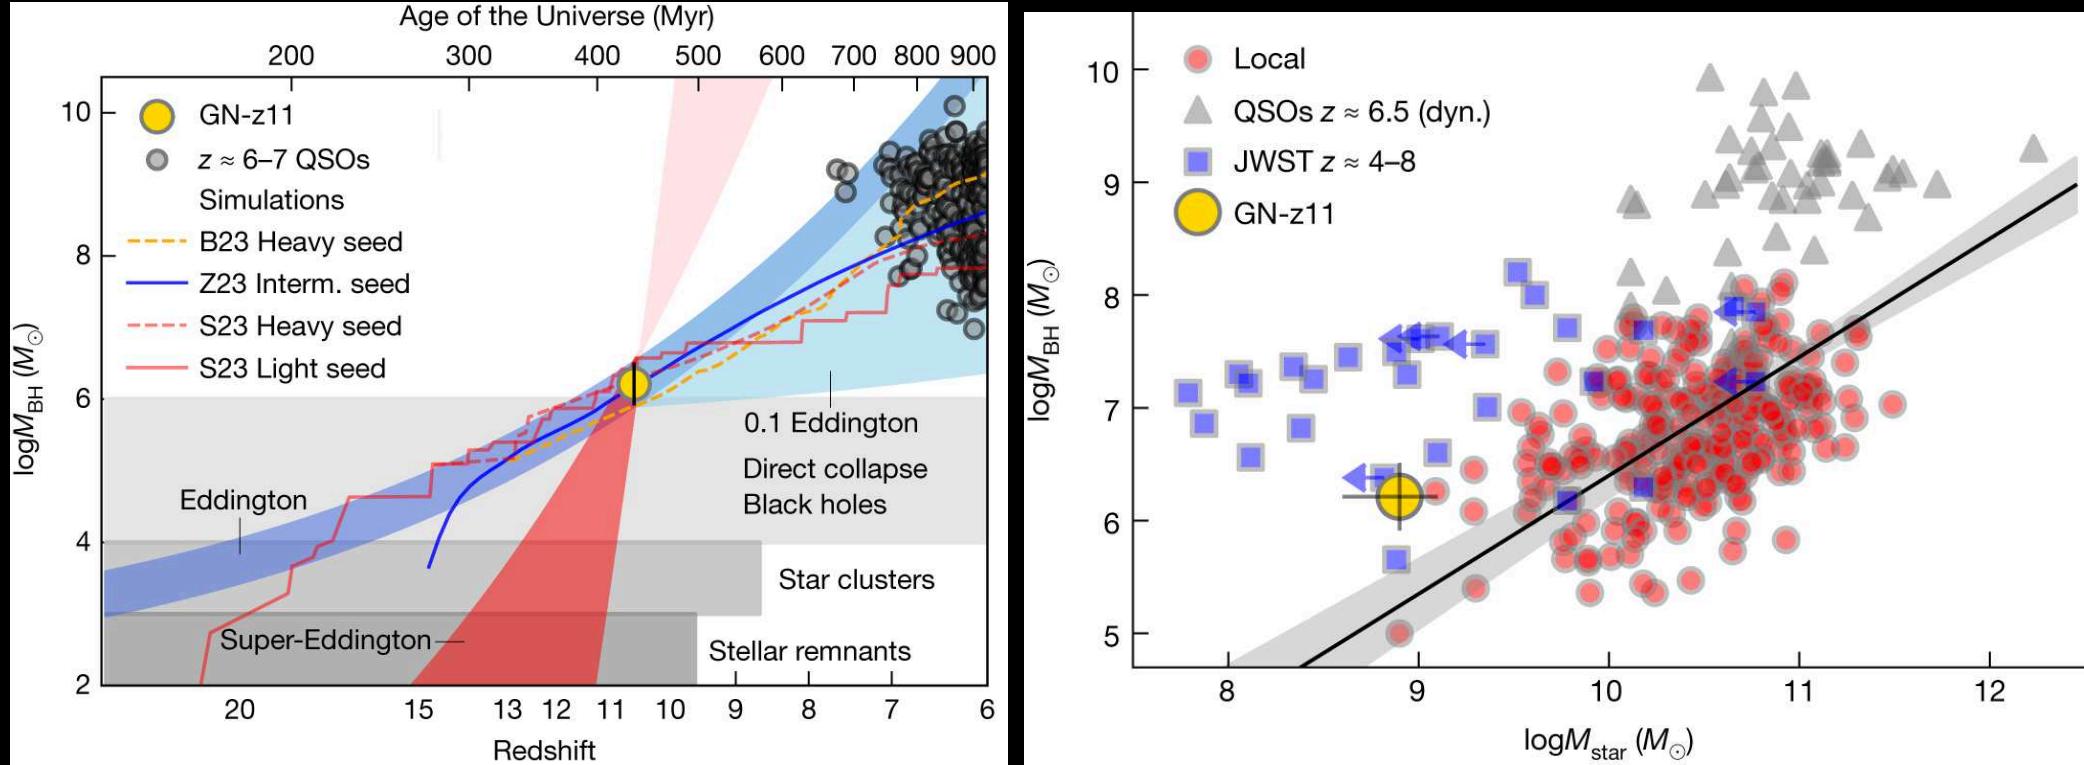

May 27, 2025: Deepest 120 hr JWST cluster image of Abell S1063 ( $z=0.351$ )!  
**Einstein's cosmic house of mirrors: many galaxies with supermassive black holes!**

Atek<sup>+</sup> (2025): [https://www.esa.int/ESA\\_Multimedia/Images/2025/05/Webb\\_glimpses\\_the\\_distant\\_past](https://www.esa.int/ESA_Multimedia/Images/2025/05/Webb_glimpses_the_distant_past)

A massive ( $10^{10.9} M_{\odot}$ ) high-z radio galaxy at  $z=4.11$  (Duncan<sup>+</sup> 2023, MNRAS, 522, 4548):

- TNJ1338: NIRCam medium-band SFR  $\sim 1800 M_{\odot}/\text{yr}$ ; extreme jet-induced SFR  $\gtrsim 500 M_{\odot}/\text{yr}$ ,  $t_{\text{SFR}} \simeq 44 \text{ Myr}$ .
- The  $\sim 10^9 M_{\odot}$  SMBH in this beast triggered its galaxy growth at  $z \gtrsim 4.2$ !

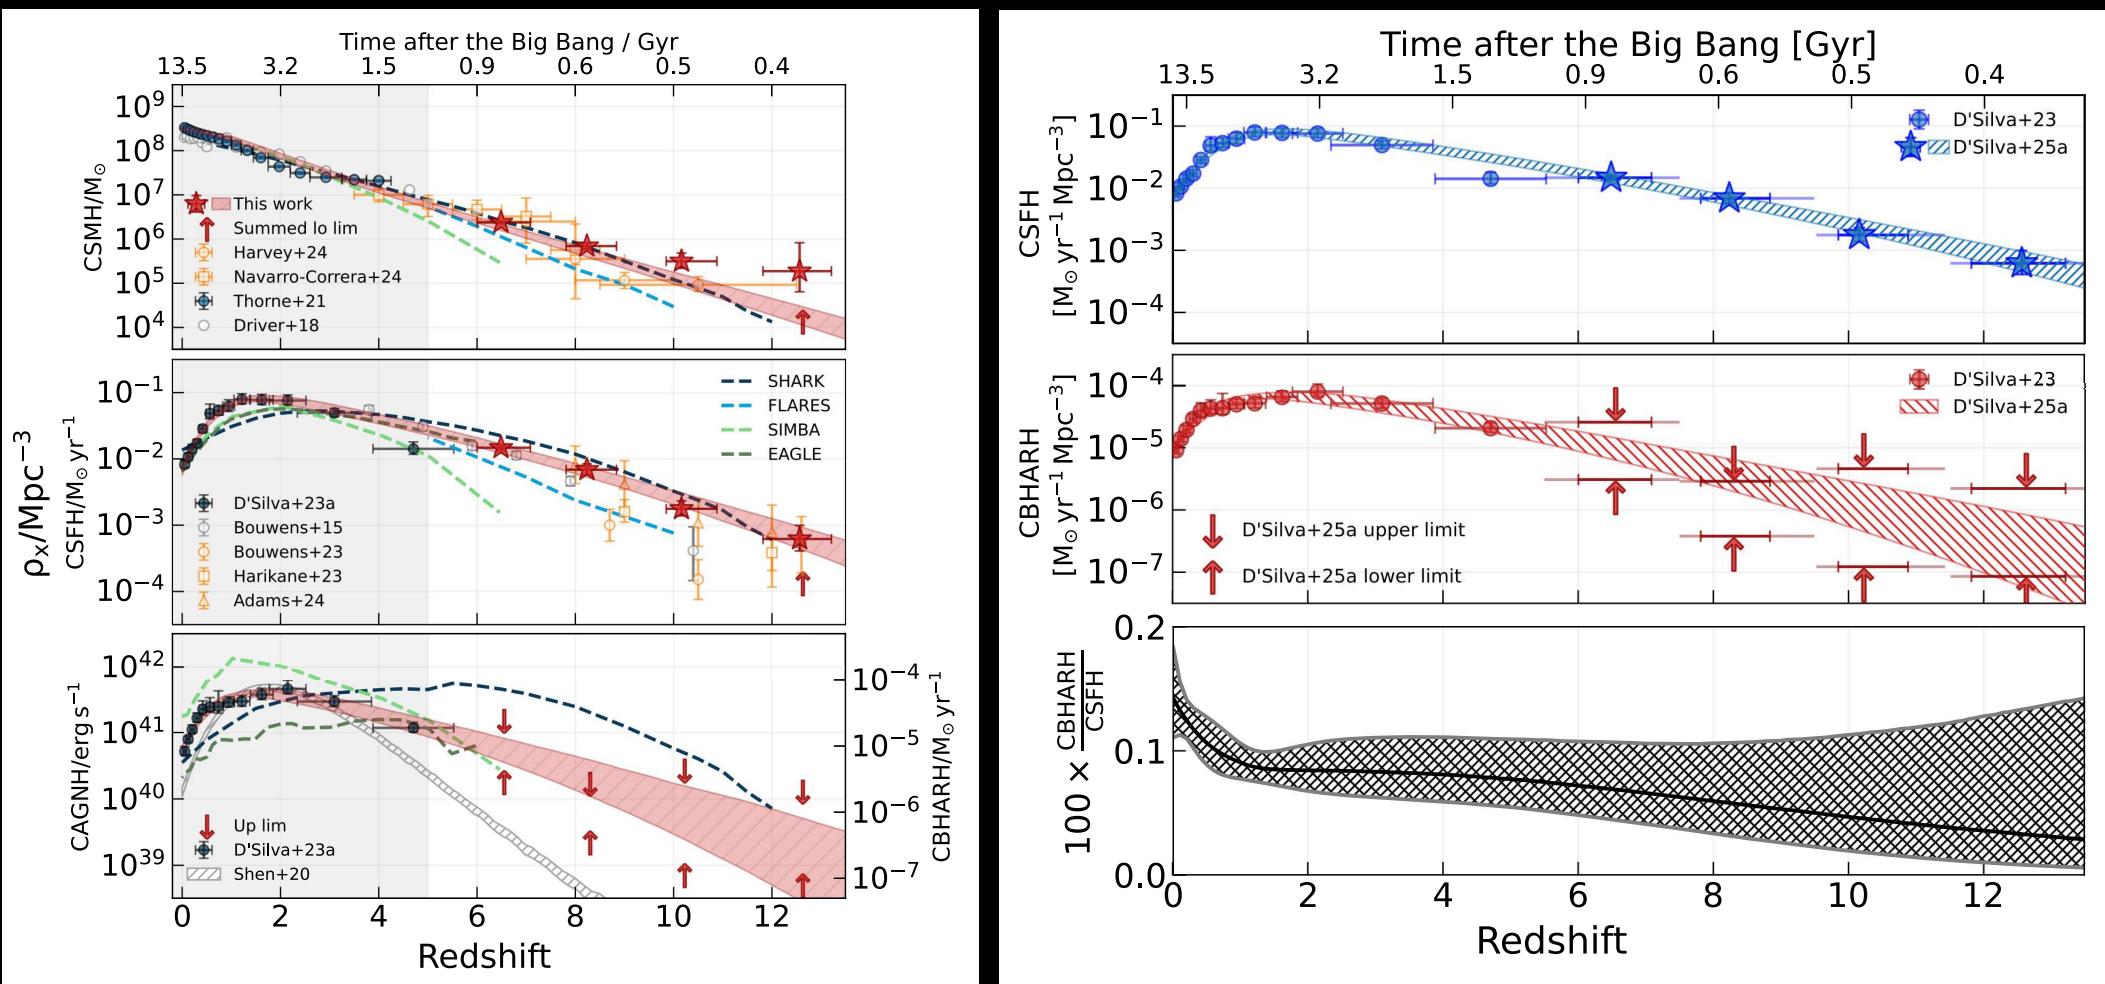

[Left] (Super Massive) Black Hole growth may start before  $z \approx 20$  (175 Myr).

[Right] This results in overweight SMBHs compared to their host galaxies at  $z \approx 4-8$  (*i.e.*, in the first 0.6–1.5 Byr)! (Maiolino<sup>+</sup> 2024, Nature, 627, 59)

Who came first: chicken (Galaxy) or egg (SMBH)?: Most likely the egg!

# Summary of Cosmic SFH & AGN-FH from HST+JWST:

- Cosmic SFH & AGN-FH derived from multi-band HST+JWST data:
- Use ProSpect code to decompose into galaxy & AGN SEDs.

(J. D'Silva<sup>+</sup> 2023, MNRAS, 524, 1448; — 2024, ApJL, 959, L18; — 2025, A&A, 990, 44; astro-ph/2503.03431).

⇒ Within errors,  $\text{AGN-FH/SFH} \simeq \text{constant}$  at  $z \gtrsim 2$ , but increases at  $z \lesssim 1$ .  
 However, the large number of red, dusty AGN that JWST now sees at  $z \gtrsim 4$  suggests that SMBH's started growing fast, before the first galaxies.

## (4) Summary and Conclusions

(1) Webb was successfully built, tested and finally launched in Dec. 2021.

(2) Webb's first images trace the "Cosmic Circle of Life":

- Formation and evolution of stars and dust over cosmic time.
- How dust helped form exoplanets and building blocks for life.

(3) Webb is observing the epochs of First Light, Galaxy Assembly & Super Massive Black Hole-growth in detail (much through lensing):

- Formation of the first stars, star-clusters, SMBH's after 0.2 Byr.
- How galaxies assembled over 13.6 Billion years (triggered by SMBHs?)

(4) Webb has shown us our place in the universe:

- From cosmic dust we were made, and to cosmic dust we shall return!
- Webb sees stellar populations (GCs) & lensed stars at cosmological distances!

The Happy Balance

Found at GP3A.CX

Any (space) mission is a balance between what science demands, what technology can do, and what budget & schedule allows ... (courtesy Prof. R. Ellis).

- Webb is now THE highest-in-demand NASA Flagship mission ever, but Hubble remains in at least as high a demand as it was 30 years ago!

## (1) SCIENCE IMPACT BY THE HST & JWST COMMUNITY (Feb. 2025):

- HST:  $\gtrsim 500\text{--}1000$  refereed papers/year by the community since 1990.
- 45,900 HST papers on [ADS](#), 948,800 citations since 1990,  $h_{HST}=322!$
- JWST: over 2300 refereed papers ([57k cites](#)), since July 2022 alone!
- In year 1-3: JWST already outdoing HST's yearly production.

## (2) NEWS RELEASES BY THE HST & JWST COMMUNITY (Feb 2025):

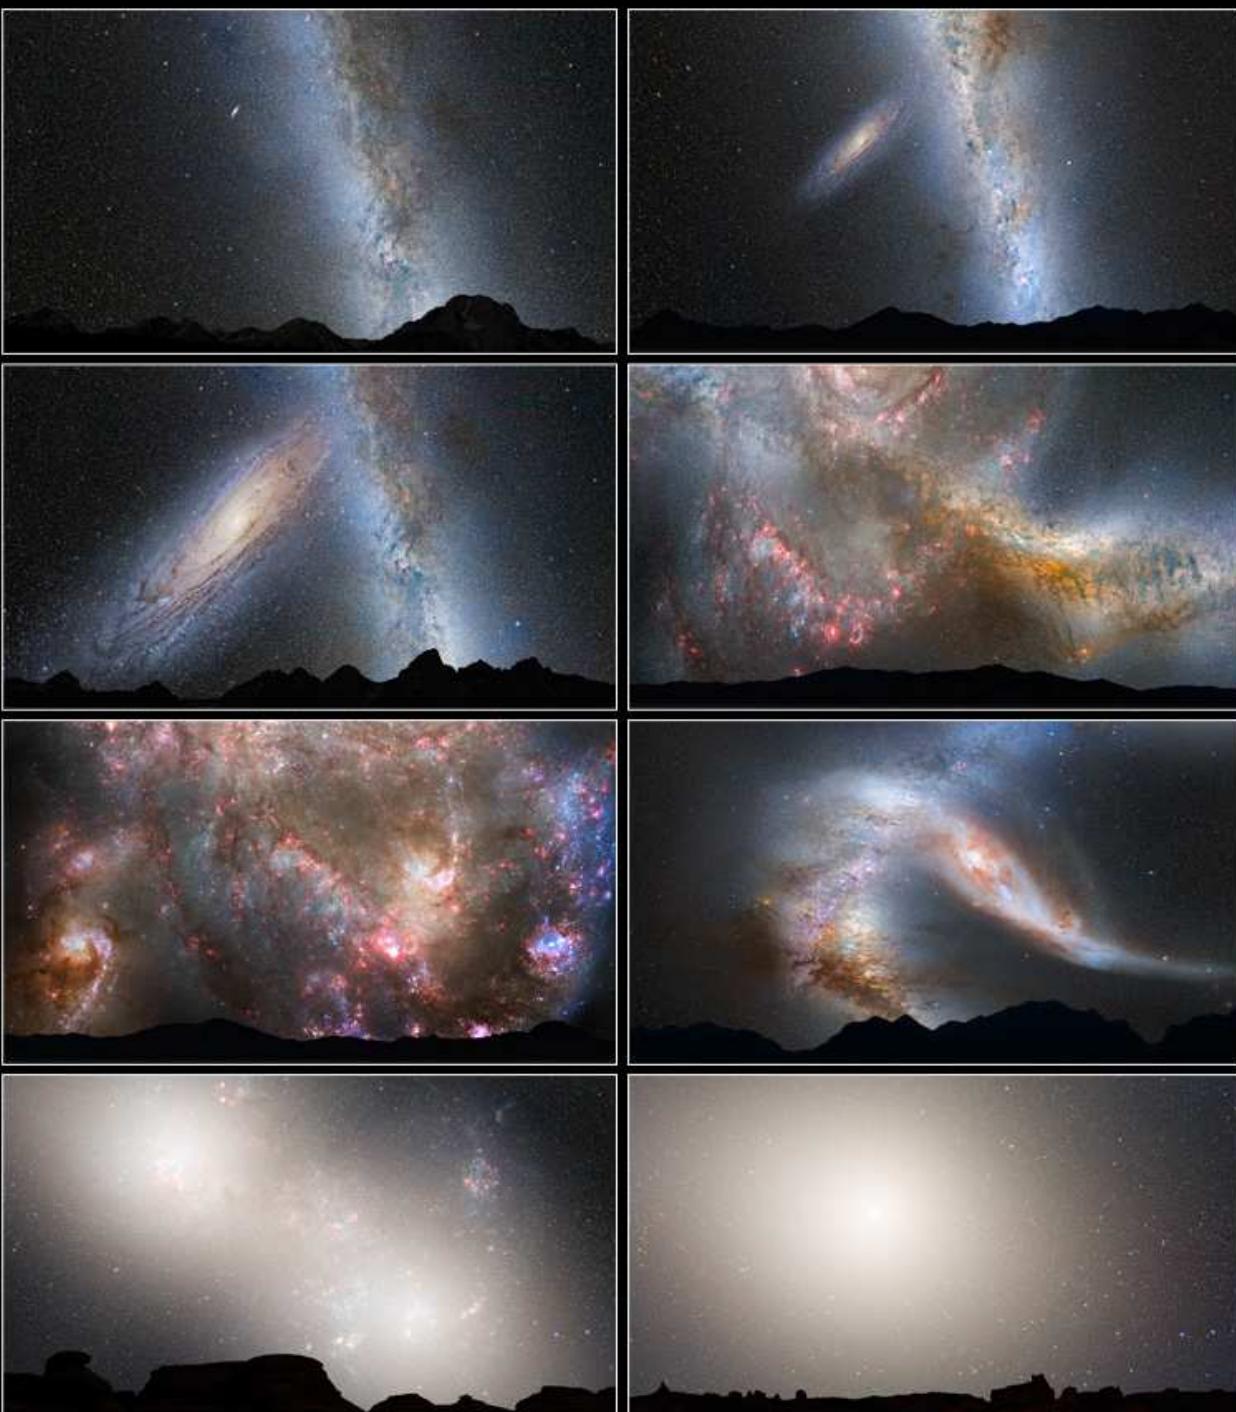

- NASA's Hubble Space Telescope (HST) had 1,100 science press releases since 1990, each with  $\gtrsim 400$  million readers (or impressions) worldwide.
- $\sim 480 \times 10^9$  reads (or impressions) of Hubble press releases in total  $\Rightarrow$
- *On average* each human on Earth would have read  $\gtrsim 60$  Hubble stories during their lifetimes.
- HST is the most publicized space astrophysics mission in NASA history.
- JWST:  $\gtrsim 170$  press releases since 2022, each 0.5–1 billion readers.
- JWST is now the most-in-demand space mission in NASA history.
- ASU Cosmology: 10 billion [readers](#) from  $\gtrsim 10$  releases since 2022 ([URL](#)).

LEDA-2046648: a beautiful galaxy pair observed with NIRISS 1 Blyr away.

LEDA-2046648: Andromeda will collide with Milky Way like this in 4-5 Byrs.

Will this ever happen to our own Galaxy?

YES! Hubble showed no lateral motion of Andromeda:  
Approaches at  $-110$  km/s.

Hence, Andromeda will merge with Milky Way!

The two blackholes ( $10^6$ – $10^7$  suns) will also merge!

Not to worry: only 4–5 Byr from today!

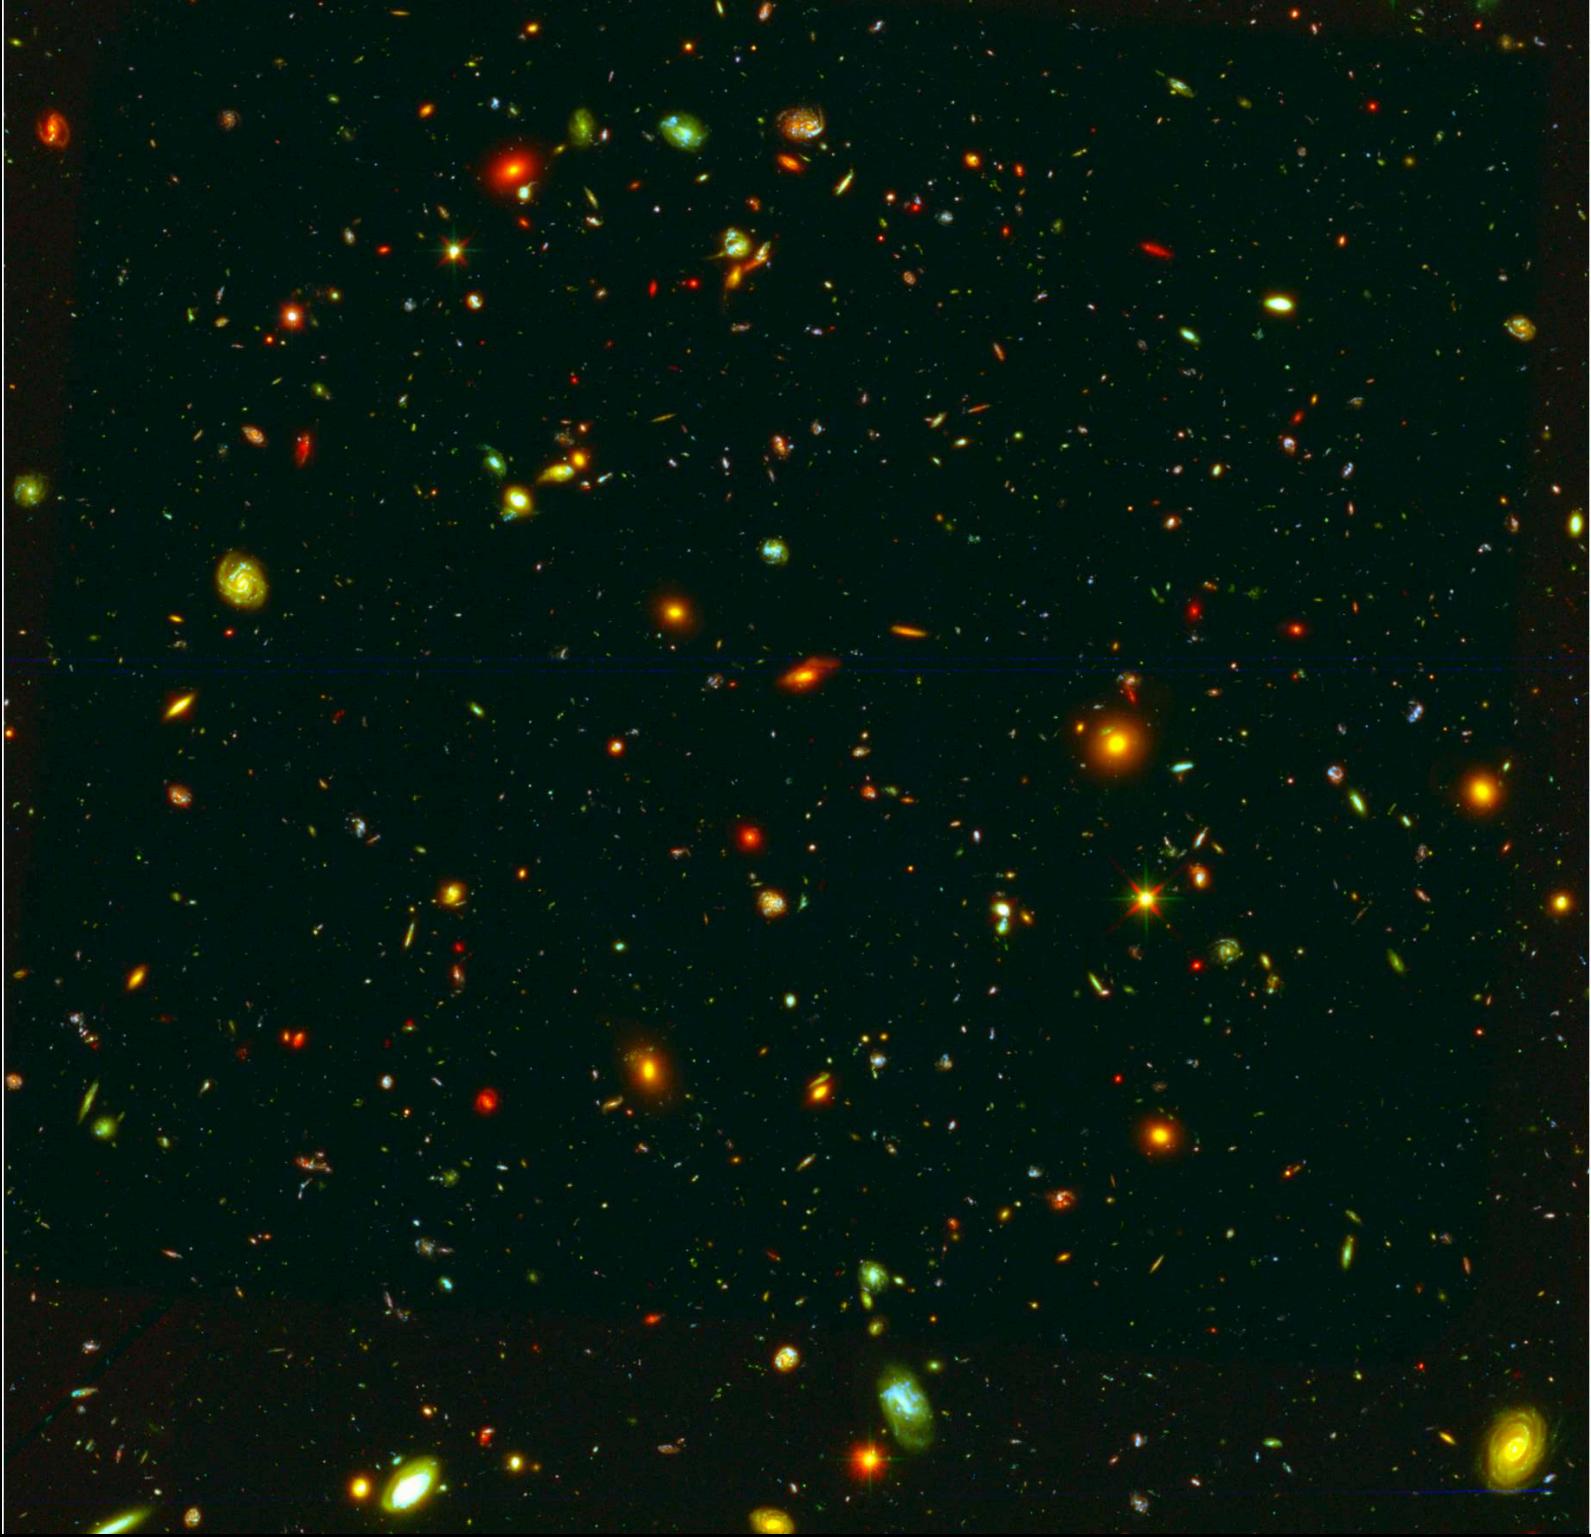

Illustration Sequence of the Milky Way and Andromeda Galaxy Colliding

## (6) Uniquely complementary roles of Hubble and Webb:

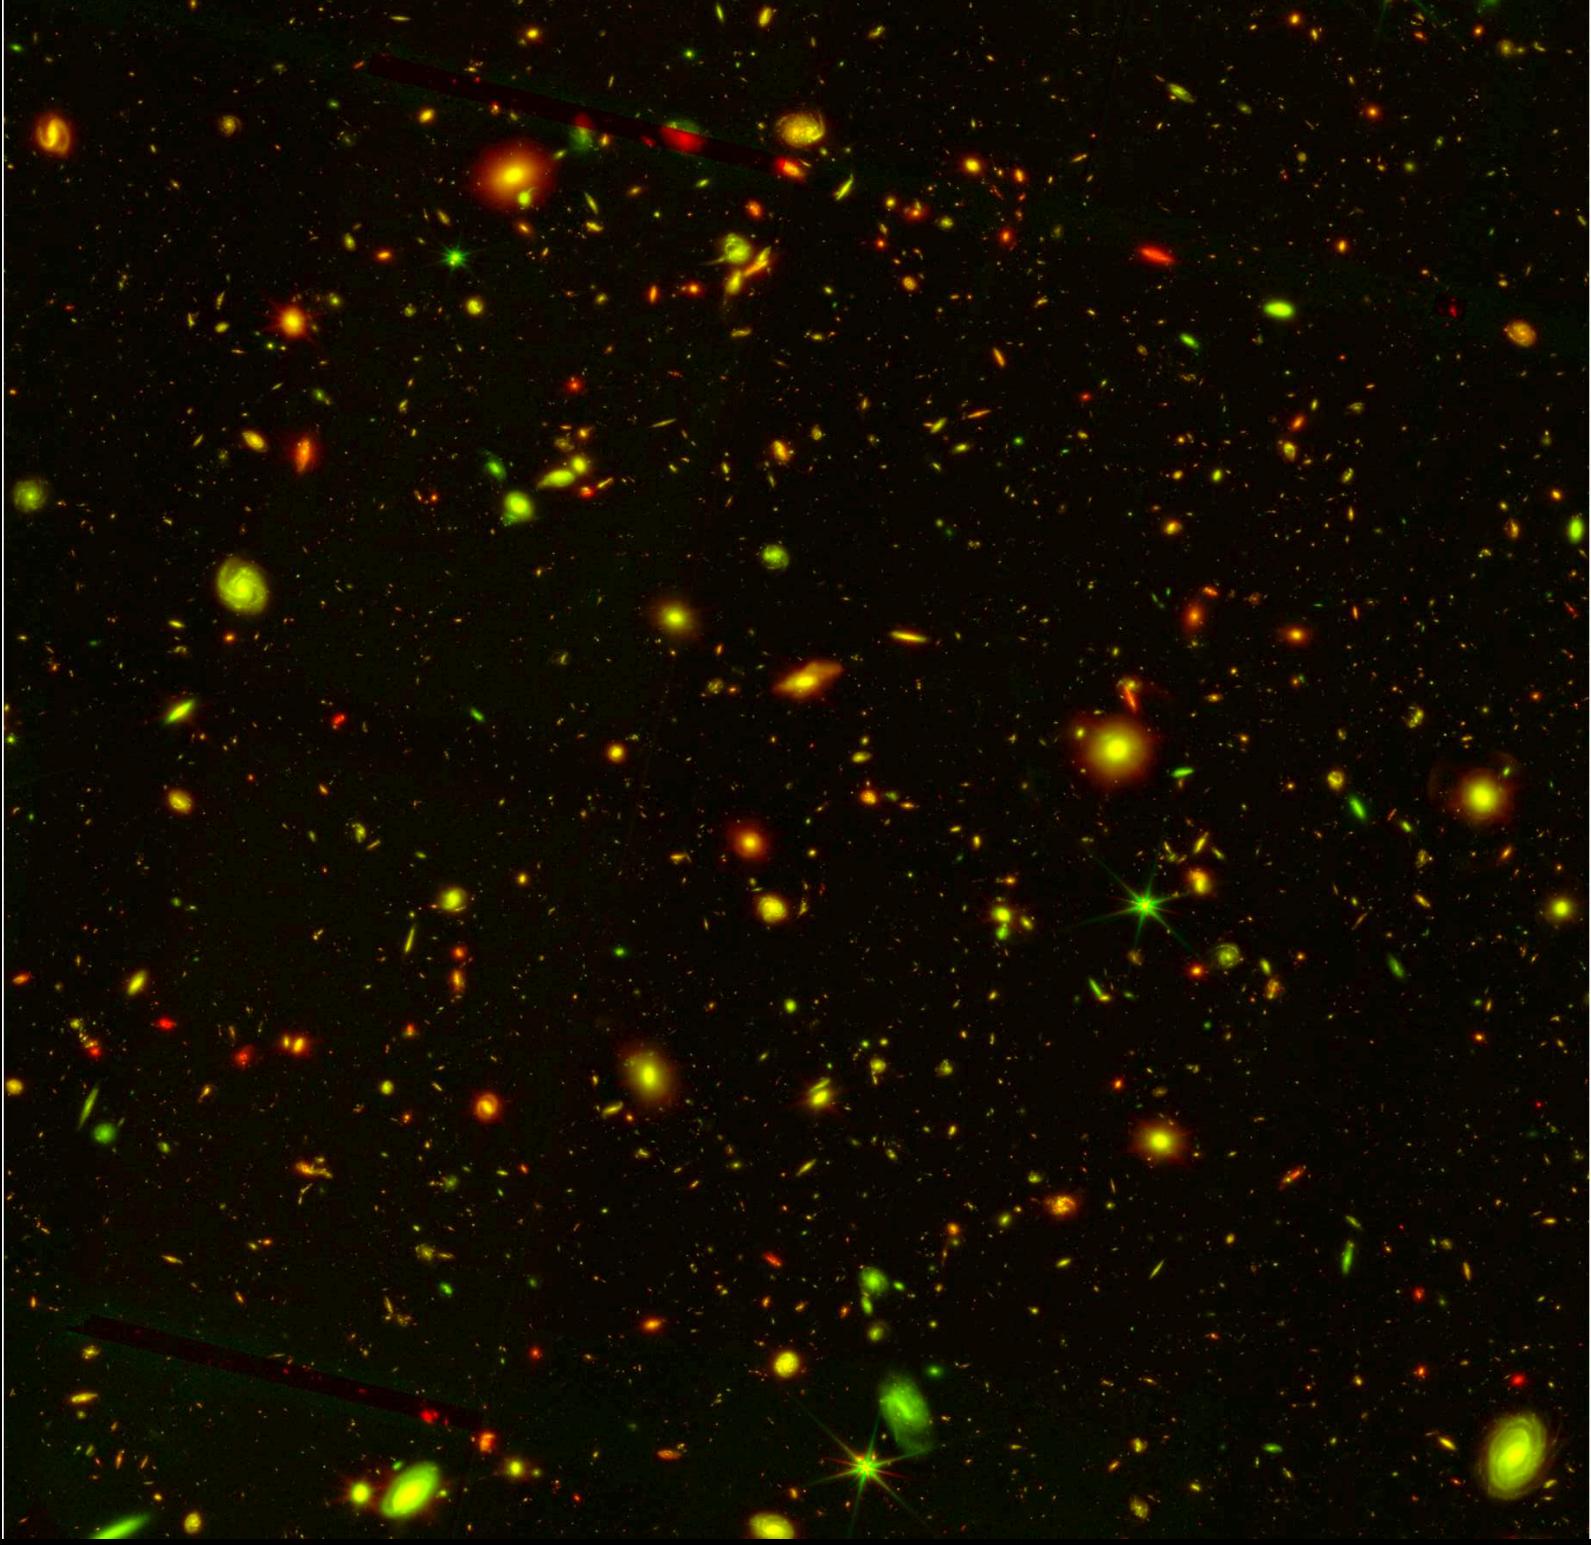

500 hrs HST+JWST: 45 filters (0.2–5.0 $\mu$ m), lensing cluster MACS0416:

- HST darkest skies ( $10\text{--}10^3 \times$  darker) + JWST's dark skies ( $10^3\text{--}10^5 \times$  darker than ground based):  
     $\Rightarrow$  HST & JWST reach 30–31 mag ( $\simeq 1 \text{ nJy} \simeq 1 \text{ firefly from Moon}$ ).

556 hr HST Hubble UltraDeep Field: 12 filters at 0.2–1.6  $\mu$ m ( $AB \lesssim 31$  mag;  $\sim 1$  nJy; full BGR).

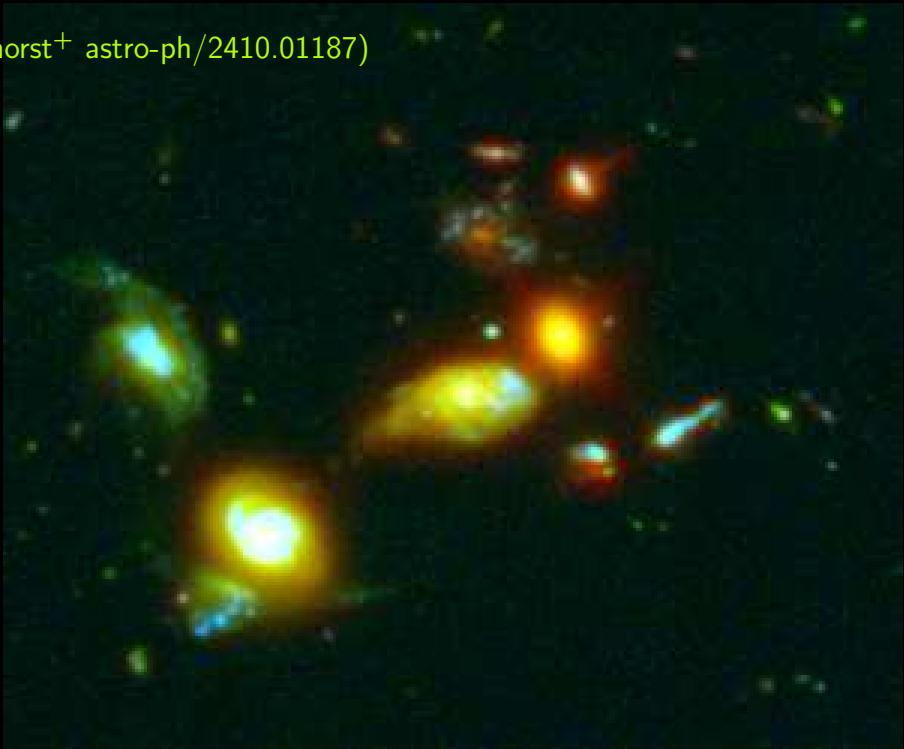

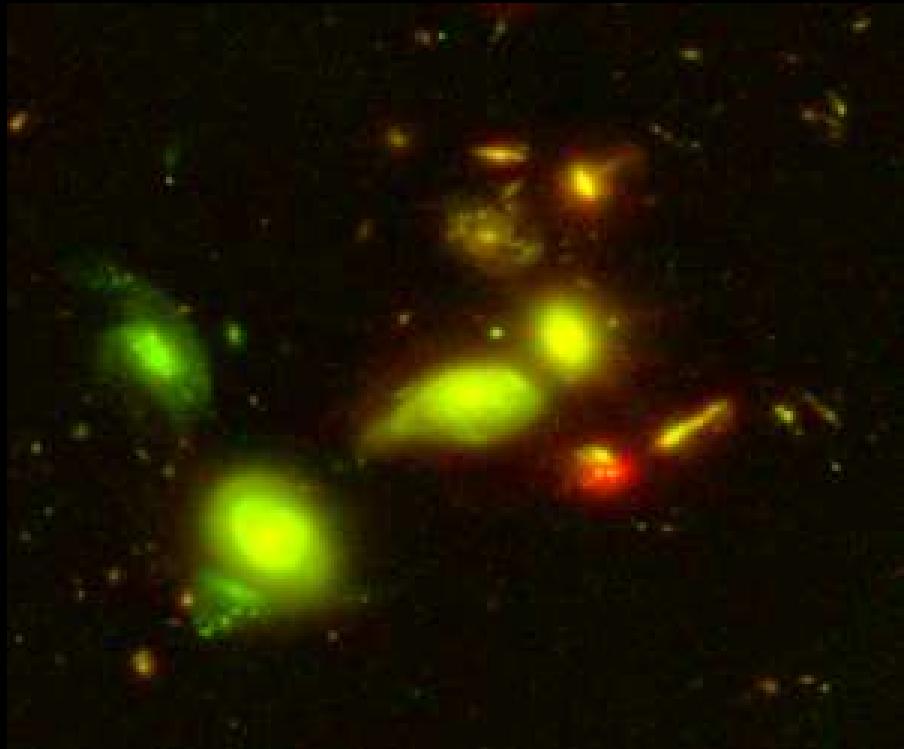

53 hr JWST/NIRCam Hubble UltraDeep Field: 12 filters at 0.9–5.0  $\mu\text{m}$  ( $\text{AB} \lesssim 31$  mag; in green + red).

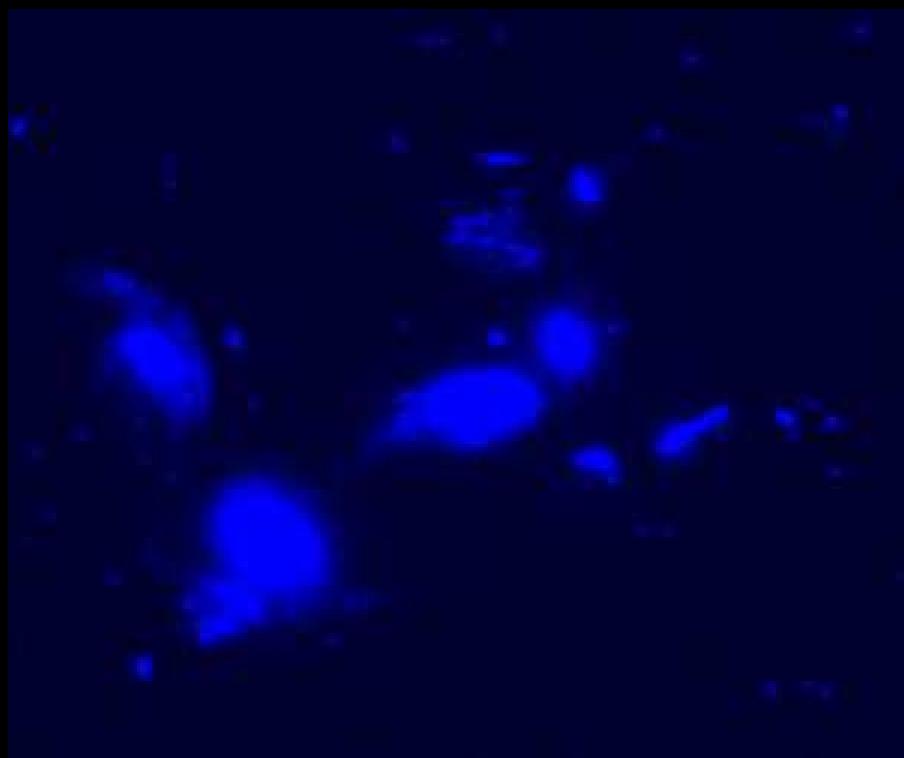

414 hr HST+JWST Hubble UltraDeep Field: 20 filters at 0.2–5.0  $\mu\text{m}$  ( $\text{AB} \lesssim 31.5$  mag; full BGR).

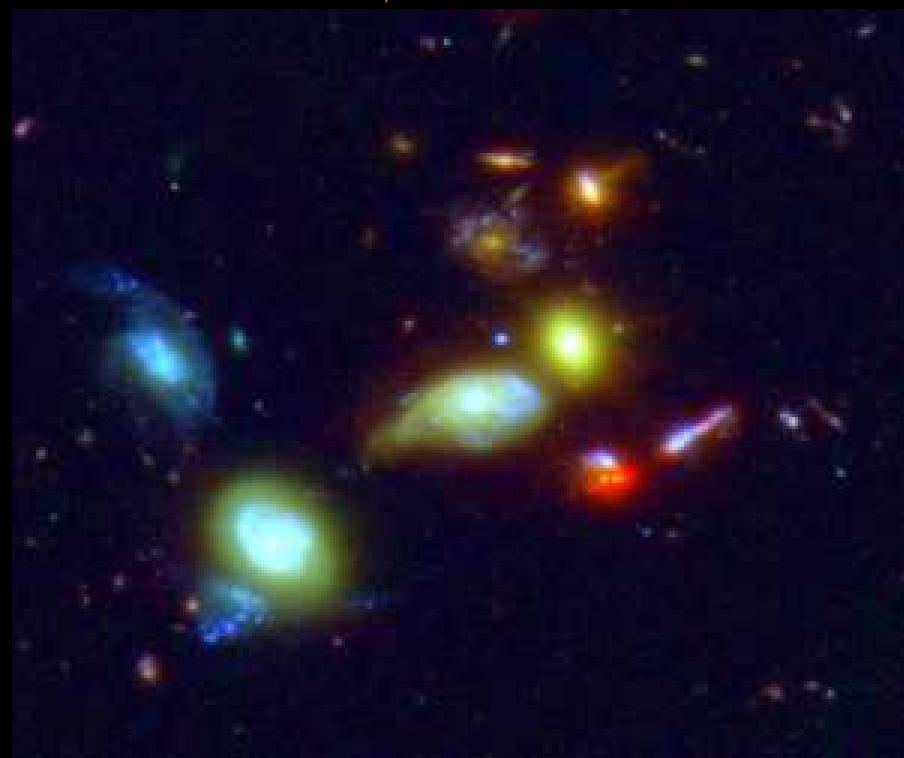

556 hr HST HUDF 12 filters

53 hr JWST/NIRCam 12 filters

361 hr 8 HST-unique filters (false-blue)

414 hr HST+JWST 20 filters
